NEW MILL.—The Templar Co., No 2, located on Indiana Ranch, Yuba county, started up their new mill on Monday last. The company have 400 tons of rock on the surface, and will soon be able to test the value of their mine.

Capitalists, Attention!
QUARTZ MILL & MINING PROPERTY
FOR SALE
In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam-power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price.
Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear rigid scrutiny, and offers superior inducements as an investment.
For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 22v12

CAUTION.

LOST—CERTIFICATE No. 23, OF TEN SHARES IN the CAMARGO Gold and Silver Mining Company—Location, Reese River—said Certificate standing in the name of the subscriber. Any person finding the same is hereby cautioned against negotiating said Stock.

Hungerford's Concentrator!
—FOR—
SAVING GOLD, QUICKSILVER,
—AND—
SULPHURETS.

MORGAN HUNGERFORD HAS MADE IMPORTANT improvements on the original HUNGERFORD & PRATER CONCENTRATOR, whereby the construction of the machine is simplified, and its operations rendered more complete and easy. It is made more effective by being self-discharging, and delivering the sulphurets more free from sand and dirt.
The Machine can be seen in operation at the Miners' Foundry, 21 First street. Call and examine for yourselves before accepting the opinions of persons more or less interested in other machinery.
Hours from 10 to 12 M. and 1 to 3 P. M.
It should be borne in mind that Mr. HUNGERFORD is the original builder and maker of the celebrated PRATER CONCENTRATOR, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.
The new Concentrator will soon be illustrated and described in the MINING AND SCIENTIFIC PRESS.
Address: M. HUNGERFORD,
22v12-tf Miners' Foundry, San Francisco.

SPLENDID

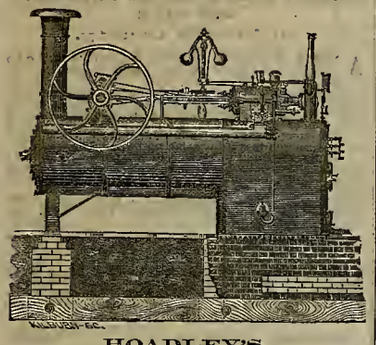
Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,



HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURability, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by TREADWELL & CO.,
18v12 Corner of Front and Market streets.

EUROPEAN METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "refractious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Oreene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY.

REMINGTONS'
ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a top strap or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the live of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

ALBERT E. CRANE, Manufacturers' Agent,
16v12 310 Washington Street, up stairs.

Vulcan Iron Works Company

Occidental Homestead ASSOCIATION,

Office, 305 Montgomery street, San Francisco.

Capital Stock : : : : : : : $33,600

102 Shares, $33 Each.

THIS ASSOCIATION was formed to enable its members to obtain desirable homestead lots in this city, at a cheap and easy rate, paying for the same by regular monthly installments. For this purpose they have purchased blocks 499, 500, and 601 in the Western Addition to this city, bounded by Davisadero, Pine, Broderick and Clay streets. Subscribers will pay an initiation fee of $5 on each share taken, to form a fund for defraying current expenses, and $11 per month for thirty months, commencing in April, 1866. The property is within three blocks of the Turk Street Railroad, is nearly all on the grade, and is most desirably located for homestead purposes. It is directly east from the lands of the California Homestead Association. The property has been purchased on very reasonable terms, and offers a rare opportunity for investment. A number of fine houses are in process of erection, and streets are being graded near this property, which will greatly increase its value.

When twelve monthly payments have been made, the property will be divided among the members in the usual manner, and each shareholder will receive a contract for a deed to the lot or lots to which he may be entitled, and have the privilege of taking immediate possession of the same. The lots average 27 feet in front by 120 feet in depth. The whole amount due upon any lot may be paid at any time, and discount at the rate of 1½ per cent. per month will be deducted therefrom. Persons wishing to visit the lands of this Association will take the Turk street cars to Devisadero street, and thence go northerly along Devisadero to Pine street.

$20,000 of the capital stock is taken, and the books are open for subscription to the balance, at the office of the Secretary, where the Official Map of the Association can be seen, and all particulars obtained.

The Title to this property is perfect.

J. S. LUTY, Secretary.

Office 305 Montgomery street, corner of Pine, Rooms 2 and 6. 20v12-tf

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATure of the State of California, entitled "An Act concerning Corporations," passed April 24, 1853, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire.....$12,973,949
Marine..... 434,408

This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JAMES C. DAYLEY, Secretary.

Office, 338 Montgomery street, San Francisco, Cal. my19

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Keokuk Gold, Silver and Copper Mining Company, Clayton District, Contra Costa County, State of California.

And in accordance with law, and an order of the Board of Trustees, made on the 17th day of April, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 626 Montgomery street, San Francisco, Cal., on the 11th day of June, 1866, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. B. WINEGAR, Secretary.

Office, 308 Front street, San Francisco. my20

Leland Gold and Silver Mining Company, San Francisco Mining District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of May, 1866, an assessment of twenty-five (25) cents per share was levied upon the capital stock of said Company, payable on the 19th day of May, 1866, in United States gold and silver coin to the Secretary, at his office in San Francisco.

Any stock upon which said assessment shall remain unpaid on the 30th day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. HOLLIS, Secretary.

Office, 302 Montgomery street, San Francisco, Cal my19

Lady of the Lake Gold and Silver Mining Company, San Francisco Mining District, Arizona Territory

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of May, 1866, an assessment of twenty-five (25) cents per share was levied upon the capital stock of said Company, payable on the 19th day of May, 1866, in United States gold and silver coin, to the Secretary, at his office in San Francisco., Cal.

Any stock upon which said assessment shall remain unpaid on the 30th day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. HOLLIS, Secretary.

Office, 302 Montgomery Street, San Francisco, Cal. my19

Lady Bell Copper Mining Company, Low Divide Mining District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of May 1866, an assessment of ten cents per share was levied upon the capital stock of said Company, payable in United States gold and silver coin, to the Secretary, C. HEYWOOD, 311 Market street, San Francisco, or to O. W. RUSSELL, Crescent City.

Any stock upon which said assessment shall remain unpaid on the 9th day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 28th day of June, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. HEYWOOD. Secretary.

Office, 311 Market street, San Francisco, Cal. my5

Lady Franklin Gold and Silver Mining Company, Silver Mountain District, Alpine County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 31st day of March, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

Office, No. 329 Montgomery street, San Francisco. my19

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

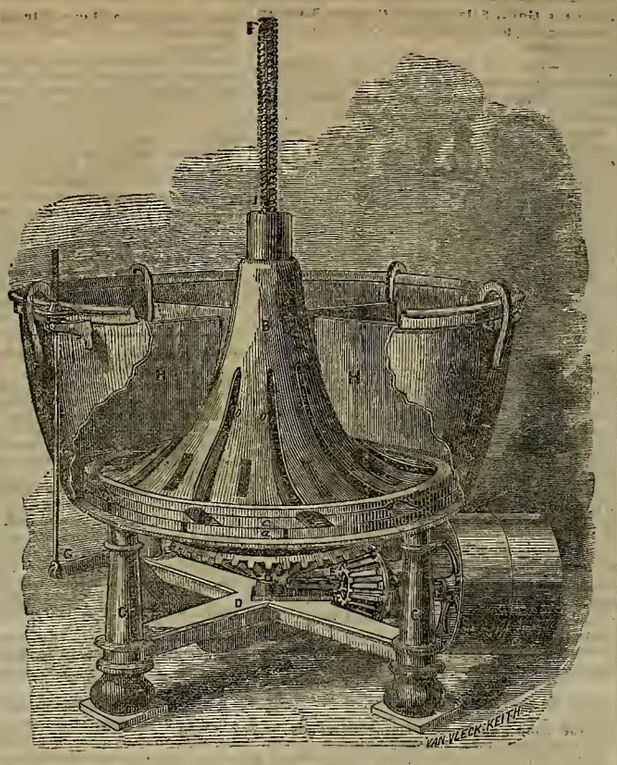
As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.



Machinery.

SAVE YOUR MONEY AND BUY,

For $100!

HUNTER'S

Premium Concentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY IMproved and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 135 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent. more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 118 Washington street, below Davis, where ALBERT JACOBS will fill their orders promptly.

ANDREW HUNTER,

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

HUGO HOCHHOLZER,
Virginia City, Nevada,
15v11tf Through Wells, Fargo & Co's Express.

BRUCKNER'S

Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED after an improved mode of construction, which

GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxydizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

will soon be more fully described and illustrated in the columns of the MINING AND SCIENTIFIC PRESS.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,
19v12 416 Market street, San Francisco.

To Ditchmen, Millmen and Others Requiring

IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12

CAPILLARY ATTRACTION.

INTERESTING EXPERIMENT.—To one who has never tried the experiment, it is quite astonishing to observe the large bulk which can be pieced in a glass goblet, already full to the brim with water; with a steady hand and the glass and water in a highly favorable condition, as many as fifteen or even twenty quarter of dollar pieces can be placed in an ordinary-sized goblet filled with water.

In performing this experiment, first procure a goblet, wipe it perfectly dry, inside and out, especially around the rim; pour the water gently into the same, until it is full even with the rim. Then drop the quarters in gently, one by one, holding them carefully about halfway down into the water before letting them drop. Be careful not to wet the edges of the glass. Cool spring water, direct from a spring or from the hydrant, should be used.

On completing the experiment you will be surprised to see how much of bulk you can thus place in the water; and how very much the water stands above the level of the brim. You will, in fact, have heaped the water up without causing it to flow over. If you have to repeat the experiment wipe the glass perfectly dry each time.

The philosophy of this experiment consists in the fact that the "cohesive attraction" of the water, tending to keep it together in a body, is greater than the effect of the "attraction of gravity," which is striving to pull the water over the sides of the goblet.

CAPILLARY ATTRACTION.—There is another class of experiments nearly allied to the above, explanatory of "capillary attraction." By close attention you will observe that as you pour the water slowly into the glass, its surface will not be exactly level; but slightly *concave* or cupped, at the edges, where it comes in contact with the glass. This concavity is caused by the attractive force of the glass upon the water, drawing up the water all around its edge a little higher than the center. The smaller the diameter of the glass, the more observable will this phenomenon become. When a very narrow tube is used, and the action is examined with a magnifying glass, the effect is most remarkable. Such experiments can only be performed by dipping the lower portion of the tube or tubes into the water, when the water rises around the sides of the tube precisely as it does when water is poured into a larger one.

When the tube is no larger than a *hair*, and a number of them are used together, the attraction of gravitation is entirely overcome, and a dish of water may be completely emptied of its contents, by having the series of tubes bent over the side so as to carry off the water, or high enough to take it all up and hold it there. For example, take a short piece of rattan or cane, which is nothing more than an assemblage of very small tubes, the whole enclosed by a close covering or skin. If a piece of cane, say an inch long, is held with one end on the surface of the water, the liquid will be found to run through the tubes to the top of the bundle of tubes. This is called "capillary attraction," from the Latin word *capillus*, a hair. The water is thus drawn up on precisely the same principle as that which causes it to stand a little higher around the edges of the glass in the first experiments of filling the goblet with water.

Capillary attraction is not confined altogether to straight or slightly bent tubes. When you place a sponge upon the surface of water, especially if it be slightly damp already, it will speedily be filled with the liquid. The sponge is thus filled by capillary attraction. If a small bundle of clean cotton lampwick be hung over the edge of a glass of water, the water will all be drawn out of the glass; and a very curious circumstance connected with this, is the fact that if the water be muddy, it will come over perfectly pure or very nearly so. This is a very ancient method of filtration.

If the water be saturated with salt or sugar, the water will come over salt or sweet as the case may be. The reason why the mud is separated and the salt or sugar not, is because the mud is mixed mechanically with the water, while the salt or sugar is in chemical combination.

When you attempt to write with ink on very poor printing paper, the ink will run from your pen and spread out on the paper; that too, is capillary attraction. Writing paper has its pores compressed and filled up with sizing, which destroys its capillary attraction. If you try to write on a piece of smoothly planed pine board, your ink will spread. Put a little pulverized chalk or resin on it, so as to fill up the pores, and rub it down smooth, and you will find no difficulty in writing. You will have destroyed its capillary attraction.

When you put out the clothes-line loosely it hangs in a curve; but if a shower of rain comes up you say it shrinks and becomes tight. Every fibre of the rope is a capillary tube; these tubes being flexible, and becoming filled with water contract in the direction of

heir length and so shorten the rope. Cloth nd the garments which are made from it, brink upon the same principle. Some cloths in being wet for the first time retain their hrinkage; others return to their original ondition after being dried. All these things re but multiplied instances of capillary attraction and its results.

Capillary attraction also exerts a most important and powerful influence in many of the operations of nature. Most of the disintegration and decay of even the solid rocks is due o this action. All rocks are more or less porous; these pores are all capillary tubes into which water is attracted, as into a sponge; by the alternation of heat and cold this water enlarges or contracts, and thus forces the particles of rocks asunder. In freezing, water exerts a most powerful expansive force, and often bursts rocks, especially when it gets into large crevices, with a loud report, riving them asunder, and rendering the smaller fragments a more easy prey to further action of the same kind.

It is by capillary attraction that the water, which has fallen upon the surface of the ground is subsequently conveyed to the roots of the plants and trees, and by them taken up and carried along the pores of the tree or plant throughout every part of its growth, taking with it the mineral and much of the organic substance, which goes to increase the growth of the same.

It is through the agency of capillary attraction that the margins of our California streams are everywhere lined with trees, and a richer verdure than the plains beyond. The porous earth upon the bank of the stream is constantly drawing up the water from the river by capillary attraction, and conveying it to the roots of the trees, etc., near by. It is on the same principle that you pour the water into the saucer in which your flower pot stands, rather than upon the earth at the top. It is better that the water should be *drawn up* through the hole in the bottom of the pot, directly to the roots of the plant.

It is through capillary attraction, in a great measure, that the animal heat in our bodies is kept up. The philosophy of this is as follows: Animal heat is produced by the combustion of hydrogen and carbon in the capillary vessels of the body. The food we eat is partially converted into blood, which contains both hydrogen and carbon. The blood, after leaving the veins, is taken by the capillary tubes into those parts of the body too minute to be traversed by veins, and the combustion referred to then takes place. This combustion consists in the combination of the carbon of the blood with the oxygen of the atmosphere. It is constantly going on in every part of the system, slow and imperceptible, but always producing a sensible degree of heat, which we call animal heat.

You must by this time have obtained a pretty good knowledge of the philosophy and importance of this great law of nature—one which, though silent and almost imperceptible, nevertheless works wonderful revolutions upon the earth's surface, and is indispensable to both vegetable and animal life.

Discoveries of the Last Fifty Years.—This is the age, among other things, of discovery. The human intellect has employed itself upon scientific investigation, within the last fifty years, with wonderful energy and success. Among the discoveries of the last century are:

The Steamboat.—Fulton launched the first one in 1807. Now there are over three thousand steamboats traversing the waters of America. Nearly all the rivers in the world are traversed by steamboats.

Magnetic Telegraph.—In 1800 it took weeks to convey intelligence between Philadelphia and New Orleans, now it can be done in as many minutes by the electric telegraph, which only had its beginning in 1843.

Voltaism was discovered in March, 1800.

The electro-magnet was discovered in 1821.

Electrotyping was discovered only a few years ago.

Hoe's printing press, capable of printing 20,000 copies an hour, is a very recent discovery, but of most important character.

Gaslight was unknown in 1800, now every city and town of pretense is lighted with it.

M. Daguerre communicated to the world his most beautiful invention in 1839.

Chloroform is also of recent discovery.

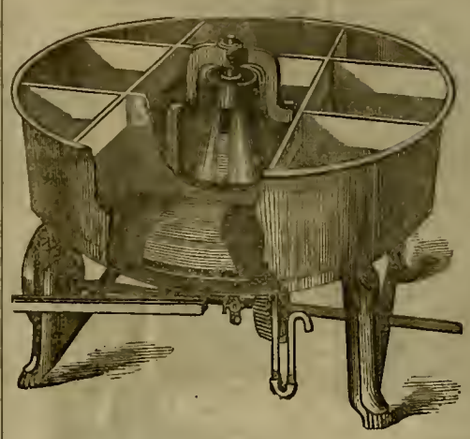
Astronomy has added a large number of new planets to the solar system.

To Preserve Hen's Eggs.—A lot of hen's eggs, buried on the ranch of Mr. S. W. Johnson, near Sacramento, during the flood of 1862, were recently disinterred, and found to be perfectly preserved. They were, undoubtedly, enveloped in a fine clay mud, impervious to air. Any other impervious coating will answer the same purpose.

Rev. J. D. Strong will lecture on *The Active Volcanoes of the Hawaiian Islands*, at the Calvary Church, Bush street, on the evening of June 5th.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of EIGHT YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

☞ For further particulars, inquire of **ISRAEL W. KNOX**, OR **W. A. PALMER**, Inventors,

14v13-p12q **At the Golden State Iron Works, No. 19 First street, San Francisco.**

A RARE CHANCE FOR INVESTMENT.

THE PATENT RIGHT FOR SALE FOR STATES, TOWNS AND COUNTIES.

For the Best Chimney Top

Ever invented. Numerous testimonials from Proprietors of Factories, Foundries, Steamers, Hotels, etc., can be shown, attesting to its usefulness in creating draft, saving the expense of high chimneys, and a great saving of fuel.

Pamphlets containing descriptive drawings and testimonials will be sent free, upon application by letter or otherwise to the patentee,

B. A. HENRIKSEN,
Or J. E. JOERGENSEN,

12v12-3m No. 328 Kearny street, San Francisco.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention. 15v12-3m

---

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

NEW MINING PUMP.

Excelsior Double-Acting Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam-power.

No. 1—Cylinder 2½ in., stroke 6 in.
No. 2—Cylinder 3 in., stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No. 5—Cylinder 6 in., stroke 18 in.

The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,
12v12-3m 120 Front street,

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

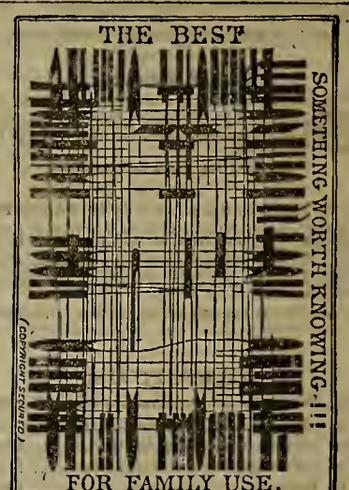
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**
1v1 San Francisco.



Explanation.—To decipher, lower top of the puzzle to an angle of 45 degrees, then close one eye, and read at your ease, when the name of the BEST SEWING MACHINE IN THE WORLD! will distinctly appear.

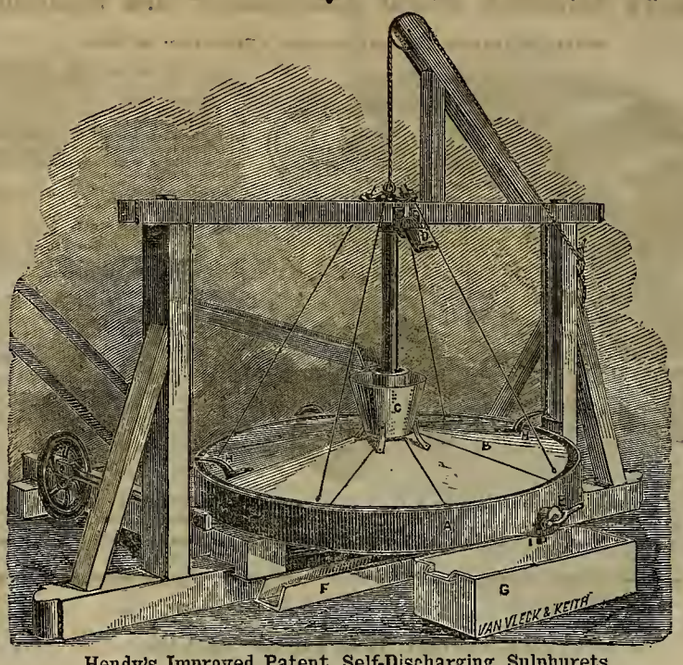
STANDARD SOAP COMPANY'S
WASHING POWDER,

THIS POWDER IS SUPERIOR TO ALL OTHER PREparations for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for using in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10 lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at **207 Commercial street,** San Francisco. 15v12q

NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets
PRATER CONCENTRATOR
Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

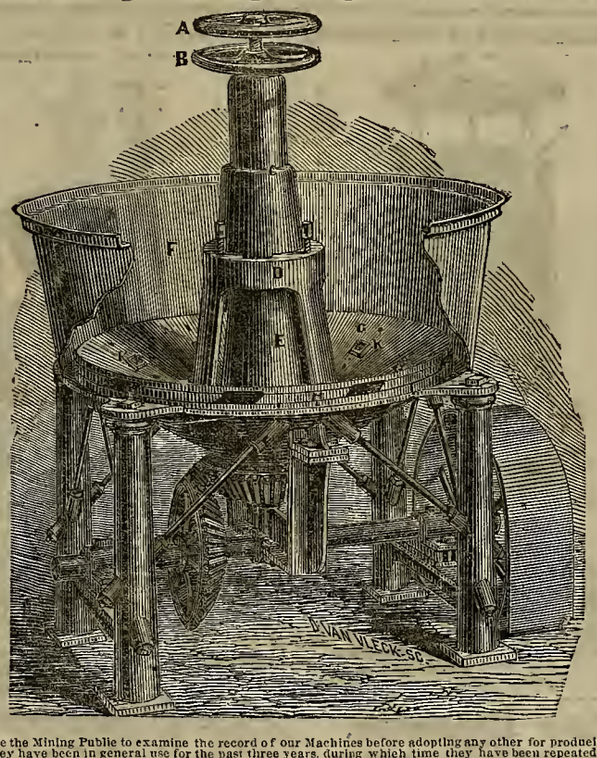
STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
OPHIR G. & S. M. CO., Newcastle, Placer County.
CONEY MILL, Jackson, Amador County.
WINNER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:
One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Six Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Dodge & Bro, San Francisco.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.
☞ For explanation of the above engraving, and other particulars, send for a Circular.

JOSHUA HENDY,
8v12tf No. 402 Montgomery street, Room 3, 4th floor.

HEPBURN & PETERSON'S PANS AND SEPARATORS.
For Reducing and Amalgamating Gold and Silver Ores.



We invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of

Principal Mills Using them:

COMMENCEMENT DAY IN OAKLAND.

Commencement Day at Oakland is fast becoming one of the most interesting days in the calendar of California—at least it is so to all that portion of our people who claim sympathy with the great Brotherhood of Letters. It is already, *par excellence*, the literary festival of the Pacific coast. It was a happy thought of the Faculty and Board of Trustees of the College of California, or whoever else may have suggested it, to originate the idea of a general association of all the *Alumni* upon this coast, with the view of holding an annual meeting at Oakland, for literary exercises and for the interchange of friendly greeting. Situated, as graduates are here, at too great a distance from their respective *Alma Maters*, to make annual pilgrimages thither, as was their wont before they placed the broad expanse of a continent between the scenes of their youth and their present chosen homes, we can conceive of no happier substitute for the customary literary festivals at the East, than this annual meeting of the "Associated Alumni of the Pacific Coast." The place and the time of this meeting has also been most fitly chosen; and each advancing year of its existence will add to it an interest which will grow with its growth and increase with its strength, until it shall hear upon its rolls the name of every friend of learning and every lover of science, who may be entitled to a membership, under the liberal rules which have been established therefor.

Wednesday last being the third annual reunion of the Associated Alumni, and the third Commencement of the College of California, was the occasion of the largest gathering of literary and professional men ever witnessed on the Pacific coast. The exercises of the day commenced at half-past twelve, and were opened with prayer by Rev. S. H. Willey, acting President of the College. The programme of exercises by the graduating class, which was delivered by excellent music by Willis' Band of this city, comprised the following pieces:

1—"Salutatory," in Latin, Clarence Fontenecau Townsend, San Francisco.

2—"Sectarianism," Lowell James Hardy, Oakland.

3—"Our California Home," William Douglass Harwood, Oakland.

4—"The Student's Retrospect," poem, Clarence Fonteneau Townsend, San Francisco.

5—"Martyrs," with Valedictory Address, Charles Ashley Garter, Shasta.

The themes were happily conceived, well written, and their delivery elicited general applause from the large audience of ladies and gentlemen in attendance. The exercises were followed by the Annual Oration, which was pronounced by the Rev. Horatio Stebbins, who, after a few preliminary remarks, announced for his subject, "What ought an Educated Man to know—to think—to be?" The subject was handled in the usual felicitous and forcible style of that distinguished orator.

After the close of the oration, President Willey conferred the degree of Bachelor of Arts upon the graduating class, whose names are given above; and also announced the honorary degree of Master of Arts upon several gentlemen.

MEETING OF THE ALUMNI.

Soon after the conclusion of the Commencement exercises, the Associated Alumni was called to order by the President, John W. Dwinelle, Esq., and opened by prayer by Rev. A. L. Stone, D. D. Judge Shafter was then introduced, and delivered the Annual Oration—a most elaborate production of high literary merit, and replete with thought and instruction. His subject was a consideration of the chief differences which distinguish the present from the mediæval age.

The speaker appeared to think that there was about as much intellectual activity in the middle ages as existed at the present time; and that the chief difference between the two consists in the fact that while the thought of the present age takes the shape of philanthropic inquiry which leads to progress, utility and correct results; the intellectuality of the middle ages displayed an equal activity, but developed itself in dogmatic controversy which led so rapidly and so surely to error of judgment, that human understanding soon came to be entirely misapplied.

It is only since the period of our colonial history that the world has been emancipated from dogmatic thought, and freed from the errors of judgment consequent thereon. A spirit of free inquiry and material progress is characteristic of the present time. The range of thought and effort has been so enlarged and ennobled, and the bonds of human brotherhood so strengthened that a vast improvement has been wrought upon the past, which gives vantage ground for attainments still higher and nobler yet.

At the conclusion of the oration, the audience was favored with some extemporaneous "verses" by Rev. Mr. Buel, which produced much merriment, and which, under the circumstances of a disappointment in a regular "poet," was probably quite as acceptable to the audience as a more elaborate production would have been.

BUSINESS MEETING OF THE ALUMNI.

After the conclusion of the above exercises the audience was dismissed for a season, and the Associated Alumni met in session for the transaction of business. The following gentlemen were elected officers of the association for the ensuing year: President, Oscar L. Shafter; Secretary and Treasurer, Prof. M. Kellogg; Executive Committee, Ed. Tompkins, Sherman Day, and Rev. S. H. Willey.

The following gentlemen were elected honorary members of the association: Dr. Henry P. Fisher, F. Bret Harte, Judges Currey and Sawyer, of the Supreme Court, D. P. Barstow, G. M. Blake, Hon. E. Gartier, W. B. Ewer, Rev. B. E. S. Ely, M. A. Low, Rev. C. Ames, Dr. R. E. Cole, W. W. Crane, Louis McLane, Rev. B. T. Martin, Jacob Hardy, T. B. Towns end.

THE BANQUET.

The business having been brought to a close, the Alumni, with their invited friends, formed in procession and marched from the Audience Chamber to the College Hall, where an elegant banquet had been prepared by the young ladies of Oakland. The tables were tastily arranged, with floral ornamentation, and loaded with an ample sufficiency of delicious berries and substantial pabulum, the excellence of which was largely enhanced by the angel-like ministering of the fair purveyors. Four tables were laid the entire length of the large hall, with a cross table at the head, every seat to which was filled. After the appetites of the classic guests had been duly appeased, the attention of the company was diverted from the more sensual creature enjoyments to "a feast of reason and a flow of soul" which none but a company so collected and so conditioned can fully appreciate. President Dwinelle, in a few brief and pertinent remarks, reminded the Alumni that another year of their associated existence had passed away since they had been last assembled around that festive board, and forthwith proceeded to announce the regular toasts of the evening.

We regret exceedingly that space will not admit of our giving those sentiments in full, together with the volunteers that followed, and the appropriate, felicitous and often elegant remarks with which they were received. Suffice it to say, that the large assembly, graced as it was, after the collation, with a great number of ladies, was held spell-bound till the president announced the near approach of 11 o'clock, the hour fixed for the departure of the special boat, which was to convey to this city a large portion of the company which had crossed the Bay to take a part in the festivities of the day. Thus has the Associated Alumni of the Pacific coast passed another most joyful and happy re-union, exceeding in interest and attendance any similar occasion of the past. May these happy and profitable seasons continue to return with augmented interest, until the classic shades of Oakland shall witness the gathering of thousands instead of hundreds to celebrate the recurring anniversaries, and recall the happy memories of their early college days.

MATCH FACTORY ON THE POTRERO.—A match factory on the Potrero, near the end of Long Bridge, has just been put in operation for turning out block matches. In this connection it is worthy of mention that there seems to be a steady demand for all kinds of manufactures in this city. New establishments are going up every week. Many mechanics seem to be overrun with business. San Francisco is destined soon to be a great manufacturing city.

"THE MUSTER ROLL" is the title of a little temperance paper which has just made its appearance in this city. It is published at 522 Merchant street. It is "devoted to the temperance cause," and from its motto we see it is determined to "fight it out on this line." May it do valiant battle and lead on to glorious victory.

RARE BUSINESS OPPORTUNITY.—We would call the attention of capitalists and those desiring to engage in a reliable and permanently profitable business, to the advertisement in this paper of land, wharf and store-houses, for sale in Alameda county. We have reason to believe this chance for investment is a good one.

POTRERO OIL WELL.—Boring still goes on at this well. The drill is now passing through lime rock and green shale, at a depth of 350 feet.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Clear Creek Mines, Kern County.

BY OUR SPECIAL CORRESPONDENT.

"Still raining!" "Will summer never come?" is the question on the lips of every one I meet. The "oldest inhabitant" has never seen the like, and the Digger Indian hangs his head and says nothing, for even in the memory of his ancestors such a season has not been known. Three days ago the hay and grain harvest was in full blast, crops were excellent, and all were in fine spirits. To-day the heavens are overspread with clouds, the rain sifts steadily down upon the valleys, and the mountains are covered with snow.

But I sat down to tell you about my trip to Clear Creek, not to indulge in gloomy reflections concerning the weather, and as the mines are the main topic of interest with the readers of the PRESS, I shall make it a point to give as full a description of those I saw, as time and space will allow.

Leaving this place at an early hour the 9th inst., I arrived, after a ride of thirty-six miles at Deer Creek, where I spent the night with a farmer, and in the morning, rode out to White River, a distance of fourteen miles, where, however, I only stopped long enough to take dinner and hait my horse, as I depended on exploring the mines on my return. I made the acquaintance, however, at this time of Mr. L. Mitchell, the merchant of the place, and Mr. Egan, Superintendent of the White River mining company, from whom I obtained considerable information which will be embodied, however, in my notice of the White River mines from notes taken on my return trip.

A further trip of three hours, over a steep, but beautifully diversified country, brought me to Linn's Valley, twelve miles further on the Clear Creek road. This is one of those beautiful elevated valleys, found in so many parts of the Sierra Nevada, where the climate is delightfully cool in summer, without being so cold in winter as to cause inconvenience and discomfort to the inhabitants, and where a rich soil and abundant water furnish all the requisite natural advantages for a prosperous agricultural community.

Sixteen miles from Linn's Valley, up a rather steep grade, brought us to the summit of the western range of the Sierra Nevada, and I saw for the first time in my life the far-famed Kern River Valley, regarded by prospectors of ten years ago, as the true El Dorado, the richness of whose placers was the theme of conversation in every miner's camp from Los Angeles to Yreka. The river winds along through green meadow lands, which seem like an emerald gem, set in strange and beautiful contrast to the bare granite hills surrounding it on every side, and seeming to form an impassable barrier between this oasis-like valley, and the outside world. The glare of the mid-day sun on the surrounding hills, only seemed to highten the effect of the cool quiet beauty of the lovely valley and its sparkling river. The summit on which we stood, was covered with quite a thick growth of pine timber, and a short distance below we came upon a saw-mill which was being fitted up for the purpose of putting it into marketable shape. This is the Summit Mill, now leased by Judge Wayland, who is putting it in thorough repair for its summer's work. Here we received a true mountain welcome, and shared the woodman's dinner, with appetites sharpened by our mountain ride, and with spirits refreshed, I resumed my journey, while my companion, being of the same political faith as the Judge, and also badly in want of office, remained behind to discuss the chances of election, and the state of the country. Twelve miles down a steep, irregular grade, and I was on the bank of Kern river, just below the little village of Kernville. One mile above the village is the establishment of the

CALDWELL AND KERN RIVER CONS. M. CO.,

Under the management of Mr. G. H. Staples. The property consists of the Big Blue mill, of twelve stamps and capable of crushing twenty tons of ore daily, together with three or four ledges located in the granite hills, west of the river. The only one now being worked is the Sherman, which is opened by two inclines, to a depth of 250 feet, showing a vein of quartz, from one to three feet in width, running in a northeast and southwest direction, and dipping westward (into the hill) at an angle of from fifteen to twenty degrees. The rock pays from fifteen to twenty dollars per ton in free gold, after which the sulphurets are concentrated on blankets and worked by a chemical process, which is said to save *all the gold;* the inventor declaring that he often *beats the fire assay.* One thousand feet east of the Sherman, is the Big Blue lead, lying in a north and south direction, and over sixty feet wide. The quartz from this lead is of a bluish cast, and assays from $50 to $200 per ton, but from some cause unknown has never paid in the mill over five or six dollars. It has been for the present abandoned, and its owners have sold their mill to the C. & K. R. Co., as above stated. I spent the night at a hotel in Kernville, and in the morning, a ride of sixteen miles brought me to

HAVILAH,

The county seat of the new county of Kern, and the general business center for all the mining region south of Kern River, and between that stream and Owens River Valley. It is situated in a deep narrow valley or cañon, on the east branch of Clear Creek, a tributary of Kern river, coming in from the south side. It contains some 500 or 600 inhabitants in the town proper, with probably as many more in the mines in the immediate neighborhood. There are half a dozen stores, three hotels, and innumerable saloons, etc., all apparently doing a good business. The hotels all have—though the buildings are unfinished—an inviting and thriving appearance, but as I was perfectly content with the first one I tried, I had no occasion for trying the accommodations of the remainder. I was, while there, the guest of Mons. L. Watier of the Golden Gate Hotel, for whom I can truly say that he makes his guests at home, and does everything in a style that shows that he "knows how to keep a hotel."

The mines of Clear Creek proper, are nearly all comprised in a strip of country about one mile wide and from three to four miles in length, on the eastern slope of the ridge, lying west of Havilah, and are all within three miles of the town. The ridge is of granite formation, steep, dry, and covered with a sparse growth of scrub oaks, chapparal and meschal, or Spanish bayonets. In some of the gulches sufficient water is found to supply a boiler and battery, but this is very rare, and most of those owning mines on the ridge are compelled to build their mills along the stream that passes through the town, and haul their rock or pack it on burros often a distance of three miles. Within the limits named from 500 to 800 veins have been located and recorded, but the number on which actual work is now going on does not probably exceed a dozen. Most of the veins are small and irregular, but the rock from nearly all is quite rich, and as the granite in which they are located is generally much decomposed, they can be worked, with proper care and economy, with considerable profit until the water level is reached. Some of them have been followed to a depth of over 100 feet without any blasting. On arriving at the water level and its accompanying hard rock, it is probable that most of these small mines will have to be abandoned on account of the great expense of working.

The most extensive enterprise in the district is that of the

NEW YORK AND CLEAR CREEK MINING CO.,

Represented here by Mr. J. C. Birdseye, and Mr. E. Bigler, a son of ex-Governor Bigler of Pennsylvania. This corporation owns twenty-five different veins, upon four of which I believe they are now at work. They have a fine 10-stamp mill which will be in operation in a few days. It is to be driven by a 40-horse power engine, and to contain all the best approved appliances for saving gold, including one of Prater's and one of Hunter's concentrators. They have also completed an excellent road to their principal mine, the Rochford, two and a half miles distant, and elevated above the mill about 1,500 or 2,000 feet. This mine is opened about 140 feet deep, and for about 150 feet along the vein, revealing a lode, running in a northeast and southwest direction, and dipping to the southeast, slightly. In width it varies from a few inches to five feet, averaging, probably twenty inches. Mr. Bigler sets down the average yield of gold at sixty-five dollars per ton. Besides the Rochford, which is the best developed of any, may be mentioned the French Friend and Cape Horn, both large fine looking ledges, also the property of this company.

Of nearly, if not *quite* equal importance with the above, is the enterprise of

COL. A. A. RAND & CO.,

Who own fourteen different veins. Their mill is situated a mile and a half northwest of Havilah, and consists now of one 5-stamp Bryan battery, which, however, is about to be replaced by a well built 10-stamp mill, driven by a 20-horse power engine. The principal mine belonging to this company is the Relief, which has been opened 195 feet deep, and 120 feet along the vein. The lode will probably average three feet thick, though its size is quite irregular. Col. R. estimates the average yield of this vein at twenty-eight dollars per ton. A small vein on the same property, the name of which I have forgotten, furnished fifty tons of quartz, paying over $100 per ton. Besides the Relief, this company own locations on the Fame, French Friend, Democrat and Josephine ledges, which prospect well. Most of these veins are quite near the mill, and the expense for transporting quartz is very light.

THE UNION MILL,

Located half a mile above the town of Havilah, and owned by C. T. Meader and J. H. Pieper, is probably the best mill now running in the district. It consists of two batteries of five stamps each, and a prospecting battery of two light stamps, with two of Hunter's concentrators, driven by a 25-horse power steam engine. It is employed partly as a custom mill, and partly in crushing the quartz from the Jenny Lind vein, which belongs to the same parties. This mine is situated on the south side of Jenny Lind cañon, three-fourths of a mile west of the mill, with which it is connected by a good road, over which the quartz may be drawn to the mill at a maximum cost of seventy-five cents per ton. A tunnel has been run into the hill on the ledge a distance of 125 feet, developing a chimney forty feet long and from one to five feet in thickness, containing *some* very rich quartz. The average pays about twenty dollars to the ton, while some goes as high as seventy-five dollars. A clay "gouge" or casing extends the whole length of the tunnel, and there are indications in the back end of the tunnel that another chimney will soon be struck.

The McKidney mine and mill have probably produced more gold than any other enterprise in Clear Creek district, but owing to a difference of opinion among the proprietors, the establishment is now closed, and I was unable to get an opportunity to examine it.

The above are the most important enterprises that have yet been undertaken in this district; but in addition to these may be mentioned the General Grant mill, of ten stamps, three miles east of the town on the opposite ridge, built to work a small vein located near, but idle just at the time of my visit for want of quartz. The Robinson mill, located between the Union mill and Havilah, of five stamps, is not yet in running order. The Thomas mill, of eight stamps, just at the lower end of town, which is kept running on rock from a series of ledges claimed by a Mr. Davis, and which are said to pay well. The Howe & Otis mill, of five stamps, is located about a mile above Col. Rand's on the ridge, and is kept busy part of the time on rock from a series of small leads owned by Messrs. Howe & Otis, which pay from $15 to $20 per ton. Messrs Marsh & Kennedy have a small water mill three miles below town on the creek, which is kept running constantly. I failed to visit this mill and make the acquaintance of its owners during my stay at Havilah, a fact which I have since very deeply regretted.

MT. SINAI DISTRICT

Is located in a depression on the summit of the second range of the Sierra Nevada, known as Tichnor's Basin, and on the headwaters of Kelso's Creek, from which it is often known as Kelso Cañon district. Claraville, the capital of this district, is about fourteen miles east of Havilah. The formation of the district is granite, the face of the country gently undulating, and good timber and water is abundant. I rode over from Havilah on the 15th, accompanied by Mr. Coleman, of the latter place, and we were joined in the evening by Messrs. Burke, Bigler and Amsbury, of Havilah, and Sanborn, of Keysville, making altogether about as merry a party as one usually finds. The whole party were very hospitably received and entertained by the miners of the new district, and in the morning, being furnished with reliable guides, we sallied out for a gallop over the hills to look at the leads, from which we returned to take dinner with Messrs. Kaufman and Chapman, of the Chapman mining company, at two o'clock in the afternoon. The principal vein in this district is the Antelope, which has been traced over a mile in a northeast and southwest direction. It is owned by about a dozen different parties, who have sunk shafts at different points on the vein, some of them as much as thirty feet deep. The vein appears to be about three feet wide, dipping slightly to the eastward, and is said to prospect well wherever opened. Parallel with the Antelope, and a short distance west of it, is the General Grant, the principal location on which is owned by the Chapman mining company. On this vein the deepest shaft in the district has been sunk by Messrs. Phillips & Henry, who are down eighty-five feet, showing a fine vein three or four feet wide, which is decomposed for a depth of seventy feet, but below this runs into a solid blue rock of a character entirely new to me, but which, I am informed, prospects well, both in gold and silver. There are several other veins in the district, most of which are small, but many of them, among which are the Hamp. Williams, the Yreka, Statesman, and others, are very rich.

D.

Visalia, May 26, 1866.

[To be Continued.]

[Written for the Mining and Scientific Press.]

From Placer County.

[By Our Traveling Correspondent.—Continued from p. 338.]

MESSRS. EDITORS: I arrived in this "ancient" and goodly town, famous in days past for its rich placer mines. It required no great skill to unlock those safes of Nature, and millions of treasure were easily extracted. It is different now. A bird's eye view discovers to me well defined gold bearing quartz ledges, crossing and recrossing mountain and cañon, peering boldly above the surface of the ground to tempt the cupidity of the "Honest Miner." And the miner is abroad. With pick and shovel in solitary places he fights the stubbornness of matter, ever assured from "indications" that far beneath lies wealth equal to that of the Grass Valley mines, which will be revealed when *capital* shall develop the claims. Favorable notices of the Newcastle and Ophir mines have so often appeared in print, that I pass them by for the present.

I first visited the Taylor company, situated on the Central Pacific Railroad, one and a half miles from Auburn. It is owned by Moses Taylor, Boggs & Woodin. It consists of 1,700 feet. The lode is three feet thick and is followed by a shaft to a depth of fifty feet. Its direction is northwest and southeast. There are two parallel veins of one foot in thickness. The one on the south dips fast toward the principal vein, and the two are supposed to connect or belong to the same lode. The rock assays from $20 to $160 per ton. This vein runs parallel to the Crœsus.

NORTH STAR DISTRICT.

The Black ledge is located three miles north of Auburn. Some very rich rock was tested by hand mortar, when at least $1,000 was taken from 300 pounds of rock. They had sunk a shaft to the depth of eighteen feet. This claim is owned by McGonagle and others. Adjoining the above is a very rich surface claim of three acres, from which over $60,000 has been taken in the past five years. Along and near the Black Ledge there is over 100 acres of placer mining ground not yet worked out. One nugget from this ground was worth $400 and another $850. Others have been taken varying from $100 to $800.

THE GREEN EMIGRANT.

This claim is located on Bald Hill about three and a half miles north of Auburn. It includes one large chimney and is very rich in gold specimens. The sulphurets are also rich. The day I visited this claim they took out the value of $100 in beautiful specimens. The deepest shaft is twenty-seven feet. They have a drift from the bottom of a 22-foot shaft, which runs sixty-five feet, cutting several veins, one of which prospected very well, paying from $75 to $80 per ton. They worked rock in an arastra which yielded upwards of $100. This vein is owned principally by McGonagle, Bell and Mitchell.

THE WHITE AND GARDINER

Is one mile north of Green Emigrant and probably a continuation of the same. It consists of 1,800 feet. The lode is four feet from wall to wall. The pay vein at the depth of an incline of 100 feet is about sixteen inches, with smaller veins coming in. Some of the rock yielded $115 per ton; $40 is looked upon as a low average. The mine is owned by White, Gardiner and Gautier.

THE WELLS LODE

Is not far from the White and Gardiner. It is of undoubted richness, gold being visible in much of the rock. The vein matter is four feet wide, and the whole amount is working ore. The owners claim for it a yield of $60 per ton, which opinion is concurred in by all who have examined the rock. The ore is now being sent to a mill for crushing, and before the closing of this letter I shall probably learn the result. A shaft is being sunk, and energy and skill are combined in bringing forth the treasure so abundantly indicated. The lode was named for its discoverers, who, with Mr. Jordan, are the present owners. Cahill & Monahan ledge is the south extension of the Wells lode, and the rock similar to the above.

GRAY EAGLE AND KENTUCKY,

Lies two miles northwest of the Wells, in Dead Man's Cañon. The lode is from six to fourteen inches wide, and the owners claim 2,400 feet. The direction of the ledge is northwest. It dips east forty-five degrees. The company

have a well built arastra which runs by water. They crushed three or four tons which yielded $15 to $20 to the ton. The rock contains much free gold. Occasionally nature presents a sample of artistic beauty amid the chaos of his subterranean works, and here I noticed among the rich sulphurets the corrolla of a flower in beautiful imitation of those which, at this season adorn the country. The owners of this ledge are A. B. Van Arsdale, W. T. and J. L. Ray.

Just below Auburn and in the same ravine, is a valuable property known as the Poland Ranch. There are several well marked veins within its bounds. The following are some of them, viz.. the American, Jackson, Conrad, Herald and Holdridge. These have been more or less prospected. Free gold is found by simply washing the dirt or crushed rock of the veins, but the chief riches seem to reside in the iron sulphurets. A ledge has been very recently located belonging to the above group. It is known as the Poland lode. The assay of the very ordinary looking ore gave seven ounces of gold and five ounces of silver to the ton. The vein matter is filled with sulphurets, and doubtless with proper concentration would furnish a very rich mass. To the same group belong the Golden Stag, Peter Walton and other leads, the value of which is well established. A very small, but very rich vein was located within the same range a few days ago. It belongs to the Stonewall company, and is a continuation of the Walton and the Poland. It varies from four inches to less than one inch in thickness. So rich in gold is it that the owners extracted $1,400 by pounding and washing within a few hours.

A large lead a few hundred yards from the incorporated limits of Auburn was located last week. It yields twenty-five ounces to the ton, mostly gold. It is a *sulphuret* vein. Another small vein of great richness was found by a wood-chopper a few days since near Bald Hill. I have not learned the names of these new discoveries.

I must not neglect the Mineralia ledge, owned by Messrs. Heley and Millett. It has been prospected fifty feet deep. The owners have entire faith in it, and are now erecting an 8-stamp mill, which they expect to have running within two months.

Truly Yours, PROSPECTOR.

Auburn, May 16, 1866.

[Written for the Mining and Scientific Press.]

Letter from Placer County.

EDITORS PRESS:—A few days ago I met in this place your energetic agent, Mr. KNOX, who was then engaged in extending the circulation of your paper with the most gratifying success, and as he found his labors in that line quite sufficient to occupy his time, he requested me to relieve him of the additional duty of sending you a report from this place—that request elicits the present letter.

FOREST HILL,

As, perhaps, the most of your readers are aware, is situated in Placer county, about twenty miles from Auburn, the county seat. I say most of your readers are probably aware of this, but there is a general ignorance in California, and particularly in San Francisco, as to the position of the different mining towns, and this place is not unfrequently confounded with Forest City, in Sierra county—I, therefore, designate it, so that its locality may be understood. The town is built upon a ridge or backbone of the lower Sierra, washed on one side by the North Fork of the American River, and separated from the associate hills of the chain on the other by a succession of mountain cañons.

For the present we will speak of this ridge from Todd's Valley, about two miles below, up to Sarahsville, an equal distance above.

CHARACTER OF THE GOLD-BEARING DEPOSIT.

A bed of gravel from one to two and even three hundred feet in depth, by perhaps a mile, and in places even two or three in breadth, extends uninterruptedly from Todd's Valley to Sarahsville, and, doubtless, much farther above and below; but within these limits it is perfectly continuous and generally uniform in character. Doubtless this gravel range, like all similar ones through the Sierras, owes its origin to ancient water currents, whose date is lost in the past. I think that about the year 1854, some casual mining operations led to the discovery of the wonderfully rich channel passing into the larger gravel bed of Forest Hill, and various tunnels were undertaken to reach it, all of which met with success—an unusual thing with general mining operations; but the rich channel continued its course with unvarying regularity through a long series of claims, and the names of the Deidisheimer, Rough and Ready, Main, Gore, Jenny Lind, New Jersey, Independence, Dardanelles, and many others which it is not worth while to particularize, would no doubt be familiar to many of your readers, and bring back reminiscences of extraordinary dividends belonging to the days of their glory.

In less than two years the Jenny Lind paid in dividends over *six hundred thousand dollars;* and the yield of other claims was equally large. But rich deposits, like other desirable things, may be exhausted, and in time the golden channel was stripped of its treasures. Then followed a period, extending over the last three or four years, of decay for Forest Hill. There were strong hopes of finding a channel further back in the hill; but much labor and money were expended without success, and the value of the mines began to be a question of grave doubt, when the discovery was made that the hard gravel forming a large part of the main deposit, impossible to reduce by any system of sluice washing, and therefore always considered worthless, might be made to yield the gold it was known to contain by stamping, and treating it in all respects like gold-bearing quarts.

An experiment was made with a stamping-mill at Sarahsville with complete success. The hard gravel there gave about ten dollars to the ton, and as the expenses for mining and milling did not exceed two, the profit was very handsome. At present, the Dewey claim at that place, with a 16-stamp mill, is paying in dividends regularly of sixteen hundred dollars per week. There are four interests in this claim, and some of them have lately changed hands at ten thousand dollars. They are now, however, being held higher.

The first mill erected upon Forest Hill was upon the Big Spring claim, and expectations of a handsome result were general; but there was a disappointment, owing either to the imperfect working of the gravel, or want of care in its selection. Soon after, Mr. Reamer, of the New Jersey, started a mill upon a claim purchased by him, and here the result was entirely satisfactory. Then Mr. Northwood began crushing from his claim with equally good results, and it may now be considered demonstrated, that in the immediate vicinity of Forest Hill there is a deposit of gravel six miles in length by perhaps three in width, of which a large part will pay for crushing. When one considers a mining field of this extent, its capacity for furnishing profitable employment, and the yield of gold which may be expected from it, it may well impress him with an idea of the future importance of this and other similar mining regions in California. A year or so ago it seemed as if the silver discoveries on the other side of the Sierra had followed upon the departed glory of the California mines, and that the bullion from them would fill the channel in which California's gold had once flowed. There is room enough no doubt for all the silver of Nevada, but any apprehension of a decrease in the yield of gold in California need be entertained no longer. Late developments in quartz and cement mines render the permanent supply of gold no longer a matter of doubt, and an increase rather than diminution may reasonably be looked for.

These cement deposits offer a wide field for the investment of capital. It is beyond question that a large amount of gravel will pay about five dollars a ton. A 10-stamp quartz mill can be erected in this district for from ten to twelve thousand dollars, and will reduce about fifty tons of gravel in twenty-four hours. The cost of extraction may be arranged at one dollar per ton, and that of reducing in the mill at about seventy cents, so that all the yield above two dollars may be considered as clear profit.

TODD'S VALLEY,

About a mile and half below, presents the same general features as Forest Hill, though the deposit of gravel was not so deep, and a great deal of it has been removed by hydraulic mining. There is still, however, a large amount of cement waiting to be worked in mills. I took a general view of the claims, and examined particularly the mine of Mr. Garland. This gentleman has a claim of six hundred feet front by more than a mile in depth, and is opening his ground thoroughly for future operations. The gravel he has taken out has paid for carrying on the work, and his claim may fairly be considered a valuable piece of mining property.

I have only given you a general view of the mining country about Forest Hill; but unless I am mistaken, you will hear of it, more particularly, as a very important gold-producing district before the year shall have passed.

Forest Hill, May 31st, 1866. V. W.

Mechanical.

AN ENGLISH TYPE-SETTING MACHINE.—Mr. Hattersly, of Hull, England, has recently invented and put in operation a type-setting machine, by the use of which, it is said, any good compositor can set up and justify at the rate of between three and four thousand types per hour, and that a much larger number per hour can be set up by those better accustomed to the manipulation of the machine. The machine has been in practical use upon a newspaper in the city of Hull for some six or eight months, and is said to work well. It should be recollected, however, that the English method of measuring type is by the "o" instead of the "m;" the "n" being considered the average size of the letters of the alphabet. The English machine, therefore, sets only about one-half the amount per hour which is accomplished by the Alden machine, an American invention.

A CHERRY STONER.—Among the recent inventions for domestic use, we may mention that of a machine designed to remove the stones or pits from cherries that are to be preserved, or prepared for pies, etc. The work is done by simply turning a wheel and placing the cherries, attached to the stem, in a little hopper or trough in front of the machine. When so placed, the cherries are first seized by a kind of fork, with a fall which detaches them from the stem, when they roll down an incline, where they are pierced and the stone or pit squeezed out and thrown in one direction, while the pitted cherry is dexterously flirted out in another, where it may be received in any convenient receptacle. The form of the cherry is not more injured in the process than it is by the most dexterous hand process, while the work is performed with great rapidity—the machine being set in motion by one hand while with the other the operator picks up the fruit by the stem and presents it to the action of the machine.

IMPROVEMENT IN PHOTOGRAPHY—A CALIFORNIA DISCOVERY.—The Copperopolis *Courier* of June 2d, says that a gentleman of Copperopolis, who has been for several years experimenting in the art of photography, has discovered a process of taking likenesses in colors, from nature. By the same process copies of paintings or engravings can be taken in a few minutes, making a perfect copy. These pictures, the editor is informed, can be taken on canvas, paper, leather or wood. What makes this discovery more valuable, is that in fixing the pictures after they are taken, a preparation of oil is used which resists water and dampness, making an oil picture which will never fade, and will last for ages. If the above report is correct, the invention is certainly a most important and valuable one.

ELECTRICITY AS A MOTIVE POWER.—Yesterday afternoon, says a late number of the *N. Y. Post*, at the Free Academy, Professor Doremus gave an exhibition of a new application of electricity as a motive power. The apparatus consists of a series of twenty-two electro-magnets, turning in double rows the periphery of a cylinder. By a simple combination, the electric current is open and broken, causing a driving shaft to revolve with wonderful rapidity and power. At its greatest speed the machine was instantly stopped and reversed, overcoming immediately the forward motion. The exhibition was very satisfactory. A more practical test will soon be made on one of the city railroads.

MACHINE FOR WORKING BLACK SAND.—William Thomas, of Birchville, Nevada county, has invented a machine for grinding black sand. The sand is separated at the end of the flume by an improved under-current machine. This sand is ground by the new machine, which consists of two arms. One of these is stationary, and the other turns in a hopper above it, in the same manner as a stone in a grist mill. He makes wages for one man, cleaning up about eighty dollars at a run.

THE transmission of sound through a deal board is quicker than through the air—about four times. By the way, to judge of the soundness of timber, place your ear to one end of the stick. If a rap at the other end can be distinctly heard, the stick is sound; otherwise not.

NEW HOISTING INVENTION.—Mr. George Williams, an English miner of twenty years practical experience, ten of which have been spent in America, the last five in the Colorado mines, is the inventer of an improvement in hoisting machinery, which, according to the Denver *News*, combines great simplicity, together with safety, durability and economy. The principal feature of the invention, for which a patent has been applied for, is the emptying of the bucket at the top of the shaft, together with the ease with which the same may be stopped and landed at the mouth of any drift in the mine. In lowering, hoisting and dumping the contents of the bucket, but a single reversion of the engine is required, and all these operations are done by a simple arrangement of the machine, or rather the guides upon which the bucket runs, and which cannot possibly get out of order. By this apparatus, there is not the slightest danger of anything falling from above, and the tedious delays attendant upon stopping, starting and reversing the motion when the bucket is at the top of the shaft is done away with, there being, as previously stated, but a single reversal necessary, and that is to lower the bucket after emptying.

AN EARTH TUNNELING MACHINE.—The *American Mining Journal* describes a new machine recently invented by Mr. R. Morton for tunneling in soft earth. It consists of a tube—the size of the tunnel—formed of circular or eliptical rings of cast-iron, (put together in segments), in front of which a large, wrought-iron wedge-shaped shield is pushed by a hydraulic pressure. This shield is made at the back of a similar section to the tube, but three feet or four feet larger diameter. In this annular space an ingenious arrangement of india-rubber tubes and glands forms a perfectly water-tight joint, at the same time leaving the shield capable of sliding forward. The pointed shield having been thrust forward a few feet, another ring of segments is added to the tube inside the shield, and the work proceeds as before. This machine, adds the *Journal*, seems to be a great improvement over those heretofore used in drifting through soft material, but it has many points in common with appliances that have for many years been used in various countries for sub-aqueous work, or such as contain quicksand, etc. Hence, while Mr. Morton is entitled to due credit for much, we imagine he hardly can have claimed it for all comprehended in his plan.

WHY is it that we can see heated and cannot perceive cold air? Refraction is usually assigned as the explanation of this phenomenon. When light passes at an inclined angle from one medium to another of different density, it is bent or refracted at the surface of the two media. As heated and expanded air rises from a warm body, it encounters air cooler and of greater density, and light in passing through strata of different densities is refracted at the dividing surfaces between the strata.

THERE is a magnet at the Free Academy of Cincinnati, which has supported seven men at one time. It is formed of two round bars of iron, each four inches in diameter and twenty-four inches in length. This is an electro-maguet, and retains its power so long as the current is running around it. Steel and cast-iron magnets are enfeebled by time.

A MASSACHUSETTS YANKEE has invented a cotton-picking machine, which, it is claimed, will do the work of twenty men, gathering cotton as clean as the most expert hand could do it, at a distance ranging from six inches to six feet, and taking it only from the bolls which are ripe and well open, leaving the undeveloped pods uninjured, and not harming the plant.

A TIMBER built up of sound plank and bolted at intervals, with holes suited to the size of the stick, is stronger than a solid one. The reason is that a built-up stick is of equal density throughout, while a natural one is weakest in the center.

WIRE CLOTHES LINE.—A galvanized wire clothes line is said to be a great desideratum, as it does not injure the clothes, and being itself uninjured by exposure, it does not require to be housed.

YOU can carry steam a thousand feet with little loss from condensation, provided the pipe is well protected against radiation by wood ashes.

VERY hot metal does not make as smooth a casting as dull metal, but will make a stronger one and finish up better.

THE love of pleasure betrays us into pain; and many a man, through love of fame, becomes infamous.

TO RENDER wood incombustible. Whitewash with chloride of lime.

Grinding Effects of Differently Formed Plates.

THIRD REPLY TO W. A. GOODYEAR, CIV. AND MIN. ENG.

BY P. M. RANDALL.

EDITORS MINING AND SCIENTIFIC PRESS:—In your publication of May 26th, Mr. Goodyear announces that he has retired from the field.

On leaving, he saw fit to honor me with a parting salute—a volley of words—and though its notes fall on the ear like the sullen mutterings of an exhausted and distant storm-cloud, which, while passing, cast its bolts around as though on destruction bent, yet courtesy, since I am all unhurt, compels me to respond.

This cry on the part of Mr. Goodyear of my deductions being "fallacious," and "resting upon assumptions and assertions more than questionable"—of his "want of time to reply"—of my "extravagant assertions and built-up demonstrations," though seeming like the cry of a madman rather than of a mathematician and philosopher, "ought not to be, cannot be, left unanswered to produce its effect, when that effect is obviously intended to be unfavorable.". If he has any facts, any reasons, any speculations, anything that would refute or tend to refute any statement, premise, calculation or deduction of mine, let him produce them; I hold myself ever in readiness to welcome truth and discard error. We read "that one of the good spirits would not bring against the arch-enemy of mankind a *railing* accusation; and what is *railing* but general reproach, and imputation without fact, time or circumstance?" But let us see what all this farrago of Mr. Goodyear means. I asserted in my first reply that "the tractory-formed pan would do much more work than the flat or conical pan of the same weight and diameter of muller, and do the *same* amount of work at a less expense of power." Mr. Goodyear, after correcting many of his radical errors which I pointed out to him, and proved to be errors both by absolute demonstration and by our standard authors on "*Applied Mechanics*," came to the conclusion at last that my deductions were right in reference to the theoretical grinding effects of differently formed plates of the usual ring form, and same hardness, weight, and diameter; that the ratio of these effects as to the tractory and plane plates is as three to two. In other words, that the tractory muller, in the capacity of a grinder, with the same expenditure of power, by two revolutions will reduce as much ore, or other substance, as the plane muller will reduce by three revolutions. In my second reply I set forth that in the practical treatment of ores by charges in pans a portion of the entire power is expended in stirring the mass, and that the power so expended and lost, as to any useful effect, depends, among other things, upon the number of revolutions made by the muller; that each revolution costs some power, and that this loss was variously estimated, some putting it as low as fifteen per cent., and others as high as thirty-three per cent.; but whether it was more or less than fifteen per cent. did not affect the truth of the proposition. Calling the power thus lost in the tractory pan fifteen per cent., and we have—

By one revolution of muller as a grinder, = 85 per cent.
By one revolution of muller as a stirrer, = 15 per cent.
By two revolutions of muller as a grinder, = 170 per cent.
By two revolutions of muller as a stirrer, = 30 per cent.

Total expenditure in two revolutions.. = 200 per cent.

By one revolution of plane muller as a grinder ... ... $85 \times \frac{2}{3} = 56\frac{2}{3}$ per cent.
By three revolutions as a grinder. $56\frac{2}{3} \times 3 = 170$ per cent.
By three revolutions as a stirrer. $15 \times 3 =$ 45 per cent.

Total expenditure in three revolutions.. = 215 per cent.

Now, 200 : 215 :: 100 : $107\frac{1}{2}$.

Thus showing a difference in favor of the tractory pan of seven and one-half per cent., and Mr. Goodyear cannot deny, unless in some of his extraordinary investigations on transcendent inventions he has discovered and applied perpetual motion to this case, that power is expended and lost in stirring the mass, aside from the power required for grinding purposes. To express this ratio in more general terms, let r represent the percentage for stirring, then the entire power expended in the tractory pan will be to the entire power expended in the plane, as 100 to $100 + \frac{r}{2}$. Now, this is what Mr. Goodyear terms a "*soi disant*" refutation of one of his two "*main* and *important* points"—"a built up demonstration, resting upon more than questionable assumptions and assertions—*fallacious*." But let him rave and rail at *stubborn facts*, if it affords him any relief; it will, perhaps, be fully as creditable to him as some of his attempted criticisms and demonstrations. However, that Mr. Goodyear is possessed of genius, talent and education, I have said already. His last strategic movement in quitting the field, he will probably in after years point to as one of his ablest achievements, and as fully confirming my expressed opinion. It has occurred before in the history of human affairs that the hero has gained more of renown by *one* retreat than by *all* his battles. Now, as to the other "*main* and *important* point," this *ignis fatuus*, which Mr. Goodyear takes for the polar star, viz., "Uniformity of vertical wear independent of the particular form of the surfaces," let the following suffice: Armengaud and Amouroux, as already quoted, say of Scheiles' invention: "The inventor was led to the consideration of this system (tractory) of working surfaces by the IRREGULARITIES OF WEAR in the common conical plugged stop-cock. * * * Perfect uniformity of wear in the grinding surfaces is attained by the use of the curved face. * * * And the inventor states that his experimental results go to show that a two-feet runner produces as much flour as a four-feet flat millstone." Weisbach says: "The moment has to be the same on all parts of the toe (pivot), if we wish to have equal wear of the toe (pivot) and its journal, consequently, the tangent for the whole generating curve of the toe (pivot) has to to be same, *a ;*" that is, the curve is the tractory, whose surface or solid of revolution is that of uniform vertical wear.

Professor Rankin, speaking of the tractory pivot, says: "The pressure is always uniformly distributed, and never becomes, as is the case in other pivots, so intense at certain points as to force out the unguent and grind the surfaces."

The *Engineer* (London), Vol. 21, No. 538, April 20, 1866, speaking of Ericsson's Engine, says: "The weak point in this very ingenious engine is, undoubtedly, the piston. The ends, for instance, must wear unequally, and at a rate increasing with the radius of any given point from the center of vibration. Ericsson is too good a mechanic to shut his eyes to this fact, and, accordingly, when, in 1859, the United States Navy Department submitted the problem of the best screw propeller engine for solution by the engineers of America, he presented the plan of an engine similar to that of the Princeton in all essential features, with the exception of the introduction of full cylinders instead of semi-cylinders."

It is not unfrequent to see conical mullers worn away fully three-eighths of an inch more at their upper and greater base than at their lower and less base. "Fallacious" and "extravagant" as my deductions may seem to Mr. Goodyear, it is quite evident that they are fully endorsed by those whom I hope he will yet better understand, and doubtless will, unless he be like some to whom it is said, "By hearing ye shall hear, and shall not understand; and seeing ye shall see, and shall not perceive." May this last quotation not be taken for a "*slang phrase*," as Mr. Goodyear has seen fit to term some of the choicest passages hitherto quoted from the writings of Pope, Poe, Cervantes, Ballantyne, Byron, Shakspeare and Webster. However, unfamiliarity with the writings of the most renowned poets, orators and statesmen in a "scientific man," a mathematician and mechanical critic, is, perhaps, quite excusable. But it is expected of the critic, having the public interest so much at heart as to offer himself a champion to do battle against hydra-headed error—"*fallacies*," that he will not be alien and hostile to his allies; but even if unacquainted with the standard authors on the subject which he essays to discuss, that at least he knows, or ought to know, something of the principles involved. Mr. Goodyear's attempt to appear a martyr to misrepresentation, "*slang*" and ridicule, will hardly avail him. Like the kid in the fable, it is not I, but my position, the "*stubborn facts*" on which I stand, that ridicule him. This is all the misrepresentation, all the "*slang*," all the wit, all the ridicule, there is about it. He has made his own record, and "cannot argue the seal off the bond." Mercy has constrained me hitherto not to offer a blow, but to pass by some of his premises and deductions, too lame to walk even with the aid of crutches. As for example, on page 210, first column, he committed himself to "plates of the same size," and it is evident that at the time he meant it, or else was culpably reckless as to his meaning. Much more is this evident, from the fact that he coupled with the condition another entirely incompatible with it, to wit: That the plates were to have the same vertical pressure at their outer circumference while in motion." On page 290, fourth column, he says: "My comparisons * * * were not for equal weights of the plates." What signification, then, is to be attached to the expression, "plates of the same size?" Again, he says: "The volume of a solid of uniform density is, of course, proportional to its weight, and to the total pressure produced by that weight." Now, be nowhere intimates that the plates were to be of different densities. Either a want of understanding, or an attempt at deception, is the only translation of such jargon. The most charitable construction to this, as well as to his "*railings*," is, that "clothed in a lion skin" he has confronted us. What his motives may have been, I will not pretend to predict; but let him treasure this lesson, that no one possessed of a manly spirit will suffer his business and reputation to be assailed with impunity, either by the follies of ignorance, or the madness of vaulting ambition, or the lusts of gain. Let it be understood, then, that I intend to hold my position in the field until dislodged and driven from it by superior forces.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, June 9, 1866.

There is more activity in the Money Market, but we observe no change in the rate of discount for prime business paper, nearly all of this description being readily taken by bankers at 1@1¼ ₱ cent. per month. At the present moment a strong desire to remit funds eastward, while the rates of exchange are so favorable, induces a good deal of borrowing for that purpose among merchants, either with the view of anticipating maturities, or of providing for future purchases. The financial panic in London has induced the agencies of the different banking institutions in this city to strengthen themselves a little, and most of their outstanding loans on short time have been called in recently. Telegraphic advices from London to the 25th of May, would seem to indicate a renewal of the financial storm abroad, with great anxiety as to when and where it would end. Since the date of our last report, The Commercial Bank of India and the East; the Oriental Commercial Bank, limited; the Bank of London, limited; and the European Bank of London — have suspended. The losses of the first-named institution have exceeded, during the past year or two, $2,500,000, including some $1,000,000 by the San Francisco Branch. The Oriental Commercial must not be confounded with the Oriental Bank Corporation, which latter has a paid up capital and reserve fund of more than $10,000,000, and is regarded as one of the staunchest banks in London. The failure of the Bank of London appears to excite some surprise, and was evidently not looked for on this side, although its paid up capital and reserve fund did not exceed $3,500,000. The business of that bank has been transferred to the Consolidated Bank, and remittances to cover drafts will be faithfully applied to their payment.

Receipts of Bullion from the interior, since the 30th ult., amounted to $1,250,000, and during the month of May the deposits of gold and silver at the Branch Mint in this city exceeded $2,250,000.

The Bullion Market is in a state of fermentation, and the shipping demand very active at higher figures than have ruled for a long time past. Sales of Gold Bars are reported at 880@890, and silver may be quoted at 1½@2 ₱ cent. premium for average grades. Higher rates also prevail for Exchange. Currency and Bills on the Atlantic cities are offered at 38@40 ₱ cent. premium on gold. Sales of Telegraphic Transfers have been effected at 5 ₱ cent., but the closing rate is about 4 ₱ cent. premium. Sight drafts, payable in coin, rule at 2 ₱ cent. premium. Sterling Exchange for best bankers' bills, may be quoted at 48¼d.

Legal Tender Notes are dull and inactive, and small sales were made this week within a range of 74⅝@73c, closing at 72½ bid. Telegraphic advices to a leading banking institution in this city, state that the shipment of specie from New York, for the three weeks ending June 2d, amounted to $29,000,000, The latest quotation for gold is about 147.

Nearly all Mining Shares rallied materially early in the week, but since then less strength has been exhibited, and the market closes dull and inactive for most stocks. Advices from leading claims are for the most part favorable, and the financial condition of others is better than it has been at any time since the beginning of the year.

Crown Point was sold at $990@$980, but is now inquired for at $1,020 bid, $1,100 asked. The total yield of bullion for the year ending May 1st, was $689,191.37, from 18,259½ tons of ore—an average of $37.73 per ton. The cost of mining this ore has been $8.97 per ton, and the expense attending the reduction of 8,896 tons, at outside mills, was $15.27 per ton. At present about 100 tons are hoisted to the surface daily, and the west stratum, 45 feet from the main lode, is said to show some improvement. The actual receipts of bullion last month were $109,500, and a dividend of $80 per foot will be declared to-day.

Savage fell from $860 to $800, rallied to $850, and closed at $850. During the week ending June 2d, 567 tons second and third class ore were extracted. No first class ore has been hoisted recently, but considerable has been taken from the stopes, and now lies waiting the completion of tunnels to afford convenient means of exit. During the month of May, 2,714 tons of ore were sent to different mills, and receipts of bullion for the same period are said to be $80,000 in excess of disbursements.

Hale & Norcross fell from $940 to $910, and closed at $990. There is no unfavorable feature to report in this mine, and the regular dividend will be declared to-day.

Gould & Curry steadily rose from $720 to $800, and closes at $715 bid, ex-dividend. During the month of May, 5,074 tons third-class ore were shipped from the mine. Of this amount 3,340 tons were crushed at the company's mill. After the payment of a dividend of $80 per foot, the company have on actual surplus at their credit of $34,000.

Yellow Jacket has been actively dealt in, and some 300 feet were sold, steadily advancing from $540 to $700, then declining to $585, and closing at $650@660. Receipts of bullion last month amounted to $130,366.24; other receipts were $13,760.36, and the balance at the credit of the company, May 1st, was $5,338.02, making a total of $149,464.62. The disbursements for the same period amounted to $124,003.11, leaving a balance on hand, June 1st, of $25,461.51, in which is embraced a lot of wood on hand costing $15,164. The cost of crushing 2,113 tons of ore at Yellow Jacket mill was $11.42½ per ton. Latest advices from the mine are thought to be favorable, and the ore is said to be improving as raised upon.

Ophir receded from $305 to $285, advanced to $327, dropped to $290, and closed at $300. In the lower level, ore is still found in running south above the fifth to the eighth floor. How far south this body extends, or high up, cannot at present be determined.

Chollar-Potosi has been in better favor, and nearly 600 feet changed hands, rising from $210 to $260, dropping to $240, rallying to $265, receding to 210, and then selling at $212½@$217½. The Piute station presents no change, and ore in the stope over head of incline has almost given out. In running west from the Bajazette ground some ore has been found, but in raising up, the old works have been broken into without finding ore. The drift from first station, new shaft, is in some 460 feet, and it is thought that flattering indications have been met with. During the week ending June 1st, 630 tons were sent to custom mills.

Empire Mill and Mining was sold at $149@145 per share, and closes at $145 asked. The old shaft has been sunk to a depth of 650 feet—50 feet below the lower level. The company's two mills are being actively employed, and last month reduced 1,549 tons of ore from the upper portion of the mine. With no liabilities, a surplus of $8,000 remains on hand. Belcher rose from $150 to $190, receded to $170, and sold yesterday at $155@$150. Small sales of Alpha were made this week at $255@$250.

Imperial rose to 110, dropped to $100, rallied to $110 again, then sold at $107@$105, and was dealt in yesterday at $107@108. Receipts of bullion last month amounted to $70,000. There is no change in the Alta mine, but in the Holmes ground recent developments are more favorable.

Bullion advanced from $55 to $72, dropped to $53, and sold yesterday at $58. Overman has continued active at fluctuating rates, receding from $22 to $10, rallying to $44, (assessment delinquent), receding to $25½, and closing at about $29. Confidence was sold at $25@$18, closing at $22.

The total recorded sales of Stocks, Legal Tender Notes and Bonds, since Saturday last, amounted to $593,494.

Mining Summary.

CALIFORNIA.

Alpine County—

The Alpine *Miner* (late Monitor *Gazette*,) says: So many claims are now being worked hereabouts, that hardly an hour passes that we do not have fine ore, rich rock, splendid specimens, etc., presented for our admiration and inspection.....The drift running for the second chimney in the Morning Star, is now 180 feet from the point where the ledge was first struck, and has only about seventy feet more to run. ....The Pioneer mill is working over the tailings which accumulated from the run last year of IXL, Buckeye and Wild Yankee. We learn that the saving in quicksilver amounts to about ten dollars per ton.....Good rock is now coming out of the Carson lode, situated at the lower end of town, and supposed to be an extension of the Little Monster lode. Everything indicates a permanent vein of first-class ore....The work of cutting across the lode by the American Company, is progressing finely, the cut being in about twelve feet. Several strata of fine looking ore have been discovered. ....In the George Law, two shifts are pushed ahead the work night and day, and having "picking rock" they are getting underground and toward the ledge very rapidly. They are now in over 240 feet....The Good Hope Gold and Silver Mining Company has, under the enabling act of 1864, removed its office from San Francisco to Markleeville....The Mountain Company No. 1, continue to push work, and now have their tunnel in over eight hundred feet. The new furnace for ventilating is a perfect success....Buckeye, No. 1, has been leased to an Eastern company for six years; the Buckeye company to receive thirty per cent. of the net proceeds....Buckeye, No. 2, is busily engaged in timbering and preparing a dump for ore....The Silver Mountain company are running alongside their ledge, which will be cut after going twenty-five feet further. ....Work will soon be resumed by the Lady Franklin company, on the same lode of the Buckeye, No. 2....The Pittsburg company are driving their work in good style....Work is temporarily suspended on the Rippon company's claim.

Calaveras County—

The *Chronicle* of June 2d says: We learn that two of the richest quartz leads ever struck in this county were discovered at Railroad Flat one day last week. We have not heard the particulars in regard to the width, etc., but our informant tells us that the surface rock is perfectly "lousy" with gold. Messrs. Post and Parks are the fortunate locators....We learn that Mr. Depew, who owns the fine mill in Spring Gulch, which he erected for the purpose of crushing the dirt from his tunnel claim, has procured the machinery necessary for quartz crushing, and is now prepared to do custom work. We understand he has already taken a contract to crush one thousand tons of rock for Lamphear & Co.

Fresno County—

The Mariposa *Gazette* of June 2d says: We have been shown some beautiful specimens of pure native copper, taken from the Bachman vein in Fresno county, at a depth of one hundred and fifty feet. It is found in thin layers, imbedded in the ore. Similar specimens have recently been found in the Washington vein in the same county, near Bachman....The New Idria Quicksilver mine is now producing five hundred flasks (thirty-eight thousand two hundred and fifty pounds) of quicksilver per month. This metal is all hauled to San Jose by teams, a distance of about one hundred and thirty miles.

Mariposa County—

The *Gazette* says: A rich specimen of gold bearing quartz from Snow & Co's vein, has been presented us. The vein is located near Sebastopol... Correspondent same at Buchanan Hollow, says: This morning two wagons left here for the San Joaquin, with four tons of smelted copper. The point on the river where they ship the ore and land the goods is only about thirty miles from here. Steamers of seventy and eighty tons burden can run up there regularly at this season, and boats of lighter draft can make the trip at any season....To-day, I visited the Buchanan vein, in company with Mr. Haskell, one of the proprietors....The furnace is capable of smelting about twenty tons of ore per day. The vein, or veins, for there are several of them running parallel with each other, appear to be all converging to a common center, and it is thought that they will all unite in one vein. The ore changes, as the depth increases, from carbonates to sulphurets, and the latter will probably be the character of the vein at the depth of 150 or 200 feet.

Monterey County—

A marble quarry has recently been discovered near Carmelo, and preparations are making to work it.

Nevada County—

The *National* has these items: The Kennebec company, Birchville, cleaned up after fifteen days run, $3,315....A ledge, supposed to be a very rich one, was struck by Tom Cloonan, on Daisy Hill, last Saturday. The ledge is eighteen inches thick, at a depth of eight feet. Free gold and sulphurets in abundance can be seen in the rock. It prospects at the rate of one hundred and fifty dollars to the ton. Quite an excitement exists in consequence of this discovery.....Two hundred more dwellings could be let in less than a week's time, if they were only to be had.... Brown & Brother, near You Bet, are said to be making three hundred dollars a day with their mill, crushing blue cement.

From the *Gazette* we gather the following: The work of putting up the machinery for the hoisting and pumping works on the Barrington mine is progressing rapidly. The engine will probably be ready to start on Tuesday or Wednesday next....A miners' meeting had been called at You Bet, to take into consideration the propriety of action in regard to the mineral lands in connection with the railroad grant....We understand their plan is to make out a large number of affidavits, showing that the entire township of Little York is mineral land, and file these affidavits with the Register of the Land Office in Marysville.... There has never been a time within the past ten years when the general prospects of this country were more flattering than at present ....The yield of the placer mines, though less than in early days, is considerably in excess of what it was three or four years ago, while the yield of the quartz mines has been steadily increasing, and this increase bids fair to be permanent....The Eagle company, organized at Hartford, Connecticut, for mining purposes, and incorporated under a special act of the Legislature of that State, is now commencing operations in Nevada county. The California claim, owned by the company, is now being opened. Steam hoisting and pumping works of the most approved character are being erected....The owners of the Deadwood mine, near the Oriental mill, have been engaged for some weeks in erecting works for hoisting and pumping. These are nearly completed, and they will commence operations some time this week....John Young has completed arrangements for the erection of a 10-stamp quartz mill on his ledge, near Eureka. The ledge is two feet in width, and rock enough has been taken out and in sight to pay for the mill....The Grass Valley *Union* has just paid a visit to the Allison Ranch mine, and says the company are working at a depth of four hundred and seventy-five feet, incline. We were shown one thousand ounces of amalgam, the result of four days run of the batteries. The amalgam is valued at seven dollars and a half an ounce, making the nice little sum of seven thousand five hundred dollars for four days run.

Excelsior—The *Transcript* says the 1st of July will be early enough for prospectors to go to this district. During the late snow storm, about five feet of snow was added to that already on the ground at Summit City. Previous to the last storm some few spots in the district were bare. In Meadow Lake City, a short distance from the lake, the snow was above the fences....Same of June 3d, says: The warm weather of the past week is rapidly melting the snow at the Summit. The weather during the day is almost as warm as it is at this place. Large parties of emigrants from Nevada and this place are going into the district every day....A Stock Board has been organized at Meadow Lake....A correspondent of the Lyon county *Sentinel*, writing from Meadow Lake, May 25th, says: The Ohio, in Old Man Mountain, is said to be very rich in free gold, also the Grant and Mohawk. The Excelsior mine is the deepest in the district, and shows rich in free gold one hundred and thirty-five feet from the surface. There are, I am informed, about six hundred and seventy-five locations made, and if only fifty of the number are as rich as they represent all to be, it is undoubtedly a big thing, and this is *the* country.

Placer County—

The *Herald* says the cement mills at Bath and Forest Hill are a decided success, gravel is a decided success, and the renewed prosperity of that portion of the county is fixed beyond a peradventure....From the Good Friday claim was taken the other day, three-fourths of a flour sack full of rock, which yielded $1,400....The *Stars and Stripes* says: Some specimens of float rock, picked up on Anthony Flat, below Newcastle, are exceedingly rich in small, free gold. Parties are in search of the ledge from which it came....We have been presented with a sample of rock from the Poland lead—located about a mile and a half southwest of town—which shows considerable free gold. The ledge on which the Poland company claim 1,600 feet, is about three feet in width, and shows free gold in most of the surface rock. The company have gone to work to open their ledge.

San Joaquin County—

A correspondent of the Nevada *Gazette* says Mr. L. Cook has discovered an oil spring on Mokelumne river, in San Joaquin county, near Amador and Calaveras. It exudes through the pores of soft blue rock, and floats on the water, presenting precisely the same appearance that kerosene oil does when poured upon water. All who have seen it pronounce it real petroleum. Mr. Cook expects to prospect it thoroughly.

Santa Cruz County—

The *Sentinel* says that the Petroleum company, in that place, is driving ahead in fine style. Four new retorts are now at the landing, and they will shortly be delivered at the works.

Shasta County—

The *Courier* of June 2d, has these items: The Kellinger are in with their lower tunnel 931 feet, and are in six feet on what appears to be a lead that is 26 feet wide in the upper tunnel, and assays $50 per ton.....We learn that the Chicago have sent an agent below with a quantity of the rock to show its wealth, and to buy a mill and machinery, if satisfactory terms can be made.....The erection of the flume from the Clear Creek ditch on to the divide, between Oregon and Olney gulches, is progressing, and will soon be completed..... Rector & Wright, whose discovery on Ross' Gulch, on the east side of the river, we noticed last week, are working with the most flattering success.....Steady work is being done on the Bunker Hill claim, with fair remuneration for capital and labor invested, but of late no rich pockets have been struck.....Accounts continue to come from South Fork district of a nature equally flattering and startling with those of the first discovery.....The Chinese have been admitted into the Spring Creek district, and large numbers are working there upon ground that pays two dollars per day .....Correspondence of same from Whiskytown says: The Pitchpine Co., are running a tunnel on their ledge. There is a company at work on the head of Mule Canyon on a quartz lode. The rock is decomposed..... Williams & Co. have completed their aqueduct, and it works splendidly. This company, under instructions from Messrs. Hallidie & Co., of San Francisco, have made a wire cable and suspended to it an iron pipe, seven inches in diameter, conveying the waters of Brandy Creek to their mine on Sawmill Flat..... Nate Farrington took his mill dam out last winter, and has formed a company to work the ground, which they suppose is rich. I have heard of a claim on it being sold as high as $500.

Sierra County—

Goodyear's Bar correspondence of the *Messenger* says the miners were anxiously waiting for the completion of the Water Co's flume and dam. Meanwhile, work was suspended.

Siskiyou County—

The Yreka *Union* of June 2d, says: Henry Wright, of Oro Fino, took out $8,000 in six weeks at that place.

Tulare County—

The Visalia *Delta's* Havilah correspondent says: Mining still goes on briskly, and all the mills which are working, with one exception, are paying well. The Pi Ute district grows in importance every day, and will doubtless prove exceedingly rich. New and rich lodes of copper, copper and gold, and copper and silver, are being brought to light, and some of the rock is so rich in these metals as to be malleable.

Yuba County—

The Marysville *Appeal* has these items: Specimens of rich rock from Templar No. 2, were brought down from Indiana ranch yesterday. We saw a small piece of rock; perhaps four ounces in weight, which, after being pulverized, showed about ten or twelve cents in gold....A small number of shares in the Pennsylvania company changed hands yesterday at $40 per share. The mill will begin crushing to-morrow on the new rock and run ten days before cleaning up....A year ago shares in the Jefferson mine, at Brown's Valley, could have been bought for $5. One gentleman owning 100 feet offered the lot at $1,000. This stock is now paying $10 per share per month, or $1,000, and the stock is now held at $300 per foot. The Pennsylvania stock has gone through similar mutations. It was sold a year and a half ago at $40 per foot. It then receded to $2 and $3 per foot. One gentleman gave away about 150 feet. To day $30 and $35 per foot is offered for it, and no sellers. It is worth $100 or nothing....Without particular reference to the Brown's Valley ledges, we predict that in less than two years the foothills of Yuba county will become as celebrated for paying quartz ledges as those of Nevada county. The county above Brown's Valley, is interlarded with hundreds of ledges, some of them scratched over, and others untouched. We know some of them are rich, and believe that their development will prove them valuable. There is one ledge we have in particular view, which ought not to lie idle for want of capital. A shaft has been sunk on this ledge seventeen feet deep, and several tons of quartz crushed, which paid $20 in gold and $20 in silver. If this ledge was in the vicinity of Virginia City or Gold Hill, it would be at once pounced upon by speculators, and stock held at an enormous figure.

NEVADA.

Washoe—

The Carson *Appeal* says Mr. Ash, who for some time past has been engaged in prospecting some quartz leads in the hills west of this city, got a return on Tuesday from one hundred pounds of quartz which he had worked at the Merrimac mill. The result shows an assay of $20.63 per ton. Dr. Gabbs had some rock submitted to a like process, and gets a return of $14 per ton....At the North Overman mine, Gold Hill, John Blight, was killed by falling into the shaft, 430 feet deep....Extensive improvements are being made at the Rhode Island mill.

Reese River—

From the *Reveille* we gather the following: E. S. Davis and Russell Scott, while taking a walk over the hills in North Twin River district, found, cropping above the ground, over which perhaps 500 men had passed, a huge ledge, ten feet thick, of richest silver-bearing quartz, which they located under the name of "Canada." We saw the assay, made to-day by J. S. Currie, which shows the splendid figures of $5,705.14 per ton. Same paper gives further particulars in the next day's issue, confirmatory of the above; and adds: The same parties had previously discovered and located in the vicinity three ledges, which they named the Flora Temple, Potosi, and Enterprise. The first named is about 150 feet east of the Buckeye mine, and is five feet thick, regular and well defined. The Potosi lies two hundred feet west of the Canada, and has a vein seven feet thick. The Enterprise lies on the same side of Summit Cañon as the Canada, and half a mile west of it. The ledge is apparently twelve feet thick, but its walls are undeveloped. ....In the Confidence, located by same parties in the South Twin River district, and which is believed, from its croppings, to be twenty feet thick, the ore obtained from the surface yielded by assay $113 per ton; but later developments in the croppings, which have been penetrated to the depth of seven feet, exhibit greatly superior ore, in which myriad flecks of native silver are easily discernible by the eye. ....In the Old Colony mine, about ten days ago, at the depth of 270 feet, the ledge suddenly widened to the handsome proportions of eighteen inches, displaying a mass of fine-grained, dark sulphuret ore, interspersed with occasional delicate tints of ruby. The gangue is pure quartz, holding largely silver, iron, sulphur and antimony....Two bars of bullion obtained from chloride ore of the Roanoke mine, were valued at $2,017 41, and were the product of six and a half tons of ore, which yielded at the rate of over $310 per ton.... The Nye county *News* has these items: The Succor mill, which has been running for some time past, closed down a few days since, in order to give the miners an opportunity to get ahead with ore....We are informed that the famous Buckeye claim, of North Twin River district, has been sold to the Sterling Mill company, whose fine large mill was erected at Kingston, Bunker Hill District, the past season....The Pleaides boys struck it richer than ever on Thursday last, while working in their mine, and are now getting out ore which it is calculated will pay $1,200 to the ton.... The Franklin has about seventy-five tons out. ....The Storm King about ten....The Atlantic and Pacific company will next week have a large force at work.

Humboldt County—

The *Register* of May 19th has these items: During two weeks past several parties have been making discovery, or re-location, rather, of very promising auriferous quartz veins in the range which terminates, some thirty miles down the valley, in Table Mountain....The Ruby Silver company, owning in Pine Forest District, thirty miles above Black Rock, has an excellent ledge. The entire ledge is infused with ore, which works, without assorting thirty dollars in silver, and shows by assay fifty per cent. copper.... Two assays made this week of quartz from the Silver Bullion claim show $140 and $198 per ton....The American Basin company has been considerably encouraged this week. At a distance of 600 feet in, and at a perpendicular depth of 350 feet below the croppings, a small "feeder" was struck, composed of the finest quality of Shebn ore.... A small lot of quartz from the Volunteer was worked this week at Holt's mill. It turned out a good-sized brick of crude bullion, in which gold shows plentifully.

Black Rock—

The Chico *Courant* says these mines are increasing in richness as they are developed to a greater depth, and considerable excitement exists regarding them, induced by the reports of their fabulous wealth. Assays have been made ranging from $1,000 to $10,000 per ton. They are situated directly on the Chico and Idaho stage route, about half way between Chico and Owyhee.

Pahranagat--

The Salt Lake *Vedette* of May 31st says: A friend recently from Pharanagat represents that miners are arriving daily, and much energy is manifested in the development of ledges there.

IDAHO.

The *World* of May 19th has these items: The warm weather this week has caused a rise in the waters of all the mountain streams. Moore's creek became unmanageable, and has done much damage among the claims....We understand that work is about to cease upon a number of the hill claims opposite town. It is caused by the bed-rock pitching into the hill, and the claims are becoming too flat to carry off the tailings. The proprietors will go back and lower the drains. The claims are said to pay well as far as work has been done in the hill.....A correspondent of the same paper at Florence says: "The days of rich placer strikes have passed, although all who can obtain a supply of water during the mining season are still well repaid for their labor, as is shown by the fact that wages for the last two seasons have been six dollars per day....The Meadow Creek quartz district, which has its center about six miles from Florence, on the trail to Warren's diggings, and extending from Florence Basin to four miles south of Salmon River, and up and down each side of the river several miles, abounds in silver-bearing quartz ledges, and will, in the opinion of the lucky discoverers and holders of feet, in a short time rival the far-famed "Owyhee" region....The first discovery was made by the Haepser & Liddell company, who located fourteen hundred feet. Extensions upon the east and west have been taken up. The ledge has been traced upon the surface, and good ore taken from it for eleven hundred feet easterly, and four thousand feet westerly from the discovery claims. ....A tunnel has been run between fifty and sixty feet from the surface, and a ledge of extremely rich ore, thirty-one inches in thickness, laid open. It is believed the whole body of ore exposed in the tunnel will yield from five to eight hundred dollars per ton, and specimens of uncommon richness, showing abundance of native silver, extend through the ledge as far as penetrated....The Daniel Boone, about one half mile south of the Haepser & Liddle, and running parallel with it, has been traced on the surface over two thousand feet, and prospects rich in silver ore. One company, the Californin, have run their tunnel twenty-five feet, and are progressing finely.

Owyhee—

The *Avalanche* of May 12th says: Silver and Ruby cities are to be condensed into one. The name will probably be *Owyhee*....The Ore Fino company is now working sixty hands, and supplying sixty stamps with ore....The Silver Legion—owned by the Cosmos company—has been worked all winter. The melting snows has made water troublesome, but it is nearly free now. A whim has been erected for hoisting ore and water, lowering timbers, etc., into the mine. The discovery ground of the Legion has passed into the Cosmos company's possession, at a large price, and it will be worked from two shafts. Considerable of the ore shows free metal. At the present works—first South Extension—there must be fully three hundred tons of pay ore taken out. ....The Allison mine is being worked with a large force of men. Three shifts are employed. The mine is being worked in the old tunnel and shaft, and a new tunnel is started two hundred feet south, to strike the ledge at a different place.

It is said that 125 tons of ore from the celebrated Poorman mine, at Owyheo, worked $300,000, or at the rate of $2,400 per ton.—*Reese River Reveille.*

MONTANA.

The *Post* of May 19th has these items: The Mesler lode is soon to have a 24-stamp mill, now on the way....Miles Kavanagh sold his interest in the I.X.L. lode for $25,000.... The weather has been delightful for a week. ....The first pack-train from the west had got in; they were thirty-six days from Idaho City (515 miles) by the Malade trail....The claims in Alder Gulch were flooded by the rapid melting of the snow....A 50-stamp mill is now on the road to Mill Creek from the States....A company of eight men are now engaged on a ditch which will supply water for the sluicing of about 1,200 acres of dry diggings, lying between Brown's Gulch and Silver Bow Creek. There is a fine prospect obtainable at the very surface of the ground. All the company, and those outsiders who have prospected the ground, feel sure that it will yield from twenty-five to thirty-five dollars per day to the hand....Bill Fairweather has struck it again. His hydraulics at Wisconsin Gulch are paying. The first clean-up was one hundred ounces to a fortnight's run; the second time the weather was favorable and all in working trim, therefore, in four days, one hundred and fifty-six ounces were washed out....Mallory's Bar is opening finely, and bids very fair for the future. On the rims, in the main gulch below, they are clearing from one to two ounces per day to the man....Uncle Johnson's Gulch, and the bars on White's Gulch, are yielding a rich harvest....New York Gulch is still attracting the attention of a large number of miners. It is no trouble to take out $100 to fifty square feet of bed rock....In Greenhorn Gulch as high as $46 to the pan has been taken out....The great quartz excitement near and beyond Trout Creek continues....Correspondence of same from Bannock says: The Bannock Ditch and Mining company are operating very successfully on Nugget Hill. This company are the proprietors of a ditch some twenty miles in length, which carries about six hundred inches of water....In addition to the rich placers of this region there are numerous and well defined quartz lodes, both gold and silver-bearing. No. 12, on the Dacotah, is a very fine vein. They have machinery on the way which will arrive during the summer.... The McLean and the Silver Mountain companies intend to erect mills in Rattlesnake district. ....The Huron, which was sold for $100,000, has a mill *en route* from Atchison....Messrs. McDonald, Clark, Gridley, Sullivan, Thompson and Governor Edgerton, have made large sales of property. It is reported that Mr. Sullivan has sold his own property for $80,000, Governor Edgerton for $25,000, and Gridley for $15,000....Mr. Reem writes that millions will be spent here this season, for property, furnaces and mills. Mr. R. is one of our best prospectors, and he and his partner (Mr. Bender) sold $60,000 worth of property, last fall.... Messrs. Bender, Estler, Godfrey and others, have formed the most extensive company for mining that has ever been organized in the East for this district....Col. Wood is still going down on No. 12 Dacotah, with the most satisfactory results....A friend just over from Diamond City informs us that seventeen pounds of gold were cleaned up, from one run, on the bar, below town, on the first of the week.... During the past week the work of mining has gone briskly on, in Main street, the business part of town, seriously interfering with travel and business....The pack train of Peter Riggs, consisting of twenty-four cayuse horses, all loaded with costly merchandise consigned to himself at Blackfoot City, has not been heard from since it left Walla Walla last fall.... Quite an excitement exists in relation to a new discovery, said to have been made in the early part of the week on the head waters of Big Rock creek, a tributary of Hell Gate river. We are informed that the prospecting party obtained as high as five dollars to the pan.

OREGON.

The Vancouver mines are still favorably spoken of. The *Register* says another ledge has been struck, a mile or more northeast of Vancouver ledge, and adds: "The confidence of holders increases, and they feel satisfied of a permanently rich thing."....The Columbia river at the Dalles, had been rising rapidly. At last accounts it had receded one foot; and all fears of high water this season were passed. So says the *Mountaineer*....Correspondence of same paper from Canyon City under date of May 11th, says: "The most important event of the week in the John Day mines, has been the advent of a small party of Chinese miners. ....The character of the diggings here, and the declining prospects of a considerable portion of the mines, has at length induced claim holders to turn their attention to the introduction of cheaper and more abundant labor, and it is probable that the result will prove the wisdom of the movement. The bed of Canyon creek, the flats at the mouth of the creek, and the newly discovered prospects on the main John Day river, promise well to employ thousands of laborers for years to come; that is to say, of that class who can and will work for a compensation of from $3 to $5 a day....It is to be hoped that by another year each honest miner in this country will have his dozen *coolies* delving in his claims. There is an eminent fitness in this relation of the races. ... On the south side of the main John Day, nine or ten miles below Canyon creek, is the cinnabar lead, of which so much has been said. A party has been engaged in sinking upon it, and the fact is established that it is a true lead. The ore rapidly increases in richness as they go down....Correspondence of same from Susanville, Grant county, says: "Our miners have for the past six or eight weeks, been constantly at work....One company near the mouth of Elk creek, will, before water fails, succeed in stripping their entire claims. A smaller quantity of water will suffice to clean up the bed rock where now all their pay lies, and it is known to be rich. They obtained enough from a small space of bed-rock to defray their expenses until they shall have completed their ground sluicing operations."....On the slope of the hill below the Elk Creek quartz ledge, four men in a run of two weeks, cleaned up seventy ounces of gold, as fine as that coming from a battery....Mr. McQuaid, proprietor of the Pacific quartz ledge, has made an opening in the side of the hill to the depth of fifteen feet, showing a well defined ledge, from three to four feet wide....Fred. Marhale discovered another ledge in March, which he christened Tyhee—it being one of the largest lodes in the district. A small piece of the cropping of this ledge, pounded fine on a flat rock and panned out in the usual way, yielded a fabulous prospect. An effort will be made soon to develop this ledge....The Golden Eagle are about to put an arastra at work.... A 20-stamp mill, with the necessary appliances for saving the gold, could now get all the work it could do at very reasonable prices....Mr. Milliken, in Elk creek, a few hundred yards above the town, brought in a nugget of gold, weighing, at $16 per ounce, $203. Mr. Hardy, on Deep creek, obtained from his claim last week, a piece worth at the same rate, $150. ....Same paper says in regard to the cinnabar already referred to: At the time of the discovery of the cinnabar lead on John Day river, a gentleman residing in Canyon City forwarded some pieces of the croppings to San Francisco for assay. The assayer's certificate attests that the ore yielded at the rate of $52.22 in gold, $3.50 in silver, and contained 14¾ per cent. of quicksilver.

COLORADO.

The *Journal* gives the following as the result of the last week's runs in five of the principal mills: Briggs company, 121 oz.; Black Hawk, 171; Narragansett, 130; John Sensenderfer, 140; Gunnel, 115½—in all 677½ ounces, which will leave for the East this week....The *Register* says Major Kinney, manager of the Black Hawk gold mining company's works, brought up town yesterday two hundred and fifty-six ounces handsome retort, worth about five thousand two hundred dollars, the result of five or six days run of a stamp mill on sixteen cords of ore....The *News* says: Present indications are, that not so much prospecting for new lodes will be done this season as in the past, as many of the companies propose to put in labor and capital in the development of lodes already claimed. This is as it should be, for the country needs more mining and less skimming over the surface.

UTAH.

The *Vedette* protests against the proposed division of the Territory, inasmuch as the principal mining districts would thereby be transferred to the State of Nevada. It says: "We have discovered the mines and are entitled to the benefits they will naturally afford, socially and politically, when developed. We hold now in our hands the key of the silver mines of Utah,—leave the key with us, and in a short time we will revolutionize the political and ecclesiastical systems now crushing this people."

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea,)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALItative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half-past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,
Principal of the City College.
6v12tf Or at 406 California Street.

SACRAMENTO SEMINARY.

BOARDING SCHOOL

FOR YOUNG LADIES,

Tenth Street, between F and G.

SACRAMENTO, CAL.

Session commenced January 8, 1866.

MR. AND MRS. BERMON PERRY,
7v12tf Principals.

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignatius College, Market street, San Francisco.
3v11 REV. A. MASNATA, S. J., President.

ENGRAVED TO ORDER.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

PETROLEUM AS AN ANÆSTHETIC.—According to the Boston *Medical and Surgical Journal*, petroleum naphtha has recently been brought into successful use as an anæsthetic. This is one of the most volatile liquids known, boiling at 70 degrees Fahrenheit. It has been proven that the mercury can be depressed by the evaporating qualities of this liquid to 19 degrees below zero, while through the agency of ether vapor the greatest cold produced is only six degrees below zero. It is thought that even a lower temperature than seven degrees can be produced by naphtha. Ether boils at about ninety-six degrees.

The naphtha used in the experiments made was manufactured expressly for the purpose, and it is proposed to give the name "rhigolene," from the Greek word signifying extreme cold, to this new anæsthetic. It is claimed that freezing by rhigolene is far more sure than by ether, inasmuch as the latter, requiring so high a degree of heat for boiling, often fails to produce an adequate degree of cold. It is also said that the new product is more convenient and more easily handled than any freezing mixture hitherto employed, and must eventually come into general use for small operations or local anæsthesia. When applied to the skin the first degree of congelation is evanescent; but if the application be too long continued there is danger of frost bite and consequent mortification. Dr. Bigelow, as early as 1861, successfully applied a product from kerosene as an anæsthetic by inhalation.

OIL WORKS NEAR SANTA CRUZ.—The Santa Cruz *Sentinel* says that the Petroleum oil company of that place, is now driving ahead finely under the superintendence of N. C. Walton. Four new retorts have just been received and will shortly be delivered at the works; they are of large capacity, with all the new improvements for opening and cleaning. Each weighs five thousand pounds; they are far superior to the old ones now in use. The company's team goes to town about three times a week, loaded with some two hundred gallons. These works, says the *Sentinel*, are about eight miles from Santa Cruz, and it is a great pity that the escaping gas cannot be conveyed to this place. There is enough constantly escaping to light the whole town. There are two large burners at the works, and every night the whole cañon is lighted almost as bright as mid-day. Such enterprises well deserves the success which they are now meeting.

MAP OF AMADOR.—We have received a copy of a beautifully executed and most full and useful map of the county of Amador, drawn from actual surveye by J. M. Griffith, County Surveyor, and approved by the Board of Supervisors. The map is drawn on a scale of three-quarters of an inch to the mile. We believe it has been the design of the publishers to lay down upon the map the locality of every mine and its name, together with the boundaries and name of the owner of every ranch. The general topography of the county is also very distinctly given. This is one of the most complete county maps which we have ever seen of any county outside of San Francisco, and is a credit to the publishers and the county which has had the energy and enterprise to encourage such a work to a successful issue. Every mining county in the State needs just such a map. It may be procured of H. H. Bancroft & Co. of this city.

THE PROPOSED TEACHERS' EXCURSION to the mountains will probably take place on Monday next.

IMPORTANT DISCOVERY—NITRO-GLYCERINE RENDERED SAFE.

Mr. Nobel, the Swedish engineer, and a brother of the gentleman who first introduced the use of nitro-glycerine as a blasting agent, has recently made the announcement of a discovery, which, if it should be fully realized and proved to be practical, must be looked upon as bigbly opportune and important.

It appears that since the terrible explosions in this city and at Aspinwall, Mr. Nobel has made the important discovery that nitro-glycerine may be rendered entirely inexplosive, *by adding to it about half its own bulk of the spirits of wood*—a cheap sort of alcohol distilled from woody fibre. The mixture so made is said to be absolutely inexplosive, and no more inflammable than camphene, kerosene, etc. In other words, be renders the oil entirely inexplosive for the purpose of transportation, with the capacity of being restored to its full power wherever wanted for use. Whenever it is desired to restore the explosive properties of the oil, it is only necessary to add to the compound a small quantity of water, which immediately absorbs the spirits, leaving the pure nito-glycerine to sink to the bottom of the vessel, from which it may be drawn by a faucet or syphon, in a condition ready for immediate use.

In order to satisfy the public of the genuineness of this discovery, Mr. Nobel invited some twenty scientific and practical gentlemen to accompany him to a rocky hill, just outside of the city of New York, where some heavy blasting operations were being conducted. After performing several experiments, illustrative of the character of the oil in its usual state for use, Mr. Nobel placed some of the oil, mixed with the spirit of wood, in a can, and applied the fuse in the usual way, but it refused to explode. Water was then added to the same mixture, when the oil was separated at once placed in another can and readily exploded.

Mr. Nobel then undertook to show how the explosions in Greenwich street and at San Francisco occurred. His theory is that in each of these cases the oil was contained in glass vessels, which were packed in boxes filled with sawdust. By some means a portion of the oil leaked out and mingled with the sawdust, forming a highly inflammable compound. This took fire in some manner—the burning stump of a cigar, or a spark caused by the heads of two nails coming in contact, being sufficient to ignite it, and the great heat caused by its combustion was sufficient to cause the explosion of the oil in the case. In order to illustrate this he filled a small can with the oil and packed it in a box filled with sawdust, in which he had previously poured some of the oil. On being touched with a lighted cigar, the sawdust took fire and burned with a fierce flame for a moment or two, when the oil in the inclosed can exploded with great force, utterly demolishing box and can so that no fragment of either could be discovered. Mr. Nobel claims that if the oil had been packed in sand or powdered shells, or any incombustible substance, that no explosion could have occurred, as the oil itself has no tendency to generate heat, and no temperature to which it could be subjected under ordinary circumstances, would be sufficient to ignite it.

We have condensed the above particulars from the New York *Tribune*, which paper says that the entire series of experiments seemed to prove, as fully as a single exhibition could do, the correctness of Mr. Nobel's views, and were entirely satisfactory to all who witnessed them.

The "spirits of wood" to which the *Tribune* refers, is evidently the substance described in the following section, on page 453 of Stockhardt's Principles of Chemistry:

"When pyroligneous acid is very slowly distilled, a spirituous, volatile liquid, very similar to brandy, first passes over, which is called crude *pyroxilic spirit*. The chief component of this fluid is a substance which, in its properties and changes, has great similarity to alcohol, or spirits of wine, though its constitution is different. On account of this similarity, it is called pyroxilic spirit (*hydrated oxide of methyle*).

STATE NORMAL SCHOOL—CLOSING EXERCISES.

The annual examination of the State Normal School, took place at Lincoln Hall on Thursday last. The exercises were of a very pleasing character, and were witnessed by a large number of persons. Some of the compositions of the graduating class evinced no ordinary degree of talent. The graduating class consists of twenty-two in number—five males and seventeen females.

An incident not laid down in the programme occurred at the close of the exercises, which consisted of the presentation of plate to Prof. Minns, consisting of an elegant silver goblet and a silver fruit dish, the gift of the pupils of the school. Prof. Minns responded to the compliment with much feeling, and in his usual happy manner.

An address was then delivered to the graduates by the Rev. Mr. Stebbins, at the close of which Professor Minns was again surprised by another presentation, in the shape of a costly gold watch and chain, the gift of the teachers in the public schools of this city. The contributors to this present numbered over one hundred persons, each teacher being anxious to testify in some way, however trifling, their esteem and admiration for the gentleman who has done so much for the cause of education here, and whose social qualities are the theme of universal praise among his friends and acquaintances. The presentation speech was made by State Superintendent Swett, and elicited a beautiful response by Prof. Minns, after which the exercises closed with chanting the Lord's Prayer.

A complimentary, social re-union was given at the same place last evening, by the pupils and graduates of the school, as a farewell testimony of respect and regard for the Principal of the school, Professor Minns, who is about to leave the State on a short visit to his friends at the East.

We regret to state that the only Normal School in California is without anything which can be called a library or any philosophical apparatus. For the latter the school is dependent upon such instruments as can be borrowed from other schools, or from individuals. Professor Minns has done much in this direction from his private apparatus. The building accommodations are also very meager and totally inadequate to the wants of such a school. The Normal School is exclusively a State Institution, and looks to the State alone for assistance. It is a shame that it should be thus neglected. It should be liberally aided and fostered by the State, as the great heart from which should emanate the very life blood of our educational system. It is a burning shame that such an Institution should be suffered to linger and struggle along, with a bare subsistence.

MINING IN THE EAST.—The New York *Tribune* says: "They have been finding gold in the White Mountains of New Hampshire and the Green Mountains of Vermont. In Lisbon, N. H., they are said to have a rocky peak which yields to each ton of rock twenty-eight dollars in plumbago, and twenty dollars in silver; while a vein of white quartz in that town has yielded (a little over) $867 per ton in gold and $150 in silver. One batch of samples yielded $1,500 per ton. There are similar reports from various parts of Canada and Nova Scotia.

WELL ATTENDED.—The lecture of Mr. Strong on the volcanoes of Hawaiian Islands, was well attended by a large and appreciative audience. The speaker did the fullest justice to the subject, which the time allotted to a single lecture would admit of. There are probably no volcanoes on the globe, whose phenomena may be more profitably studied and examined, than those upon the Hawaiian Islands. Their proximity to the coast of California, and the frequent mention made of them by travelers from this State, has of late elicited an unusual degree of interest, and excited a very general desire to hear and learn more about these most wonderful among the grand phenomena of Nature.

LIST OF OFFICERS OF CORPORATIONS AND MINING COMPANIES.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

[Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

BACON MILL & MINING CO.—June 5th. Trustees: Chas. L. Low, A. K. P. Harmon, Chas. K. Grimm, A. E. Head, Lewis Gerstle. President, A. K. P. Harmon; Secretary, W. E. Dean; Treasurer, Jno. Sime; Superintendent, J. B. Low.

CROWN POINT G. & S. M. CO.—June 4th. Trustees: A. H. Barker, Isaac Glazier, Geo. F. Grimes, B. F. Sherwood, H. P. Blanchard. President, A. H. Barker; Secretary, J. H. Jones; Superintendent, C. C. Batterman.

KEYSTONE MINING CO.—May 2d. Trustees: Wm. A. Dana, C. T. Meader, O. P. Sutton, R. B. Parker, Thomas McCarty. President, W. A. Dana; Secretary, O. P. Sutton; Superintendent, H. H. Sheldon.

SAN MARCIAL S. M. CO.—March 21st. Trustees: Henry Brickwedel, James Branham, Wm. Glaskin. President, Henry Brickwedel; Secretary, R. N. Van Brant; Treasurer, Sampson Tams; Superintendent, F. A. Prescott.

RECENT INCORPORATIONS.

COLUMBIA COPPER M. CO.—Little New York, Nevada county. Capital stock, $110,000; 1,100 shares; $100 per share. Trustees—E. C. McComb, J. L. Sanford, D. M. McCraith, A. J. Downer, Isaac Swain. May 2d.

RATTLESNAKE G. AND S. M. CO.—Spring Valley District, Yuba county. Capital stock, $240,000; 2,400 shares; $100 per share. Trustees—C. J. Janson, A. N. Huard, W. B. Agard, Albert Miller and Henry East. June 6th.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented or forwarded to us by mail or express prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

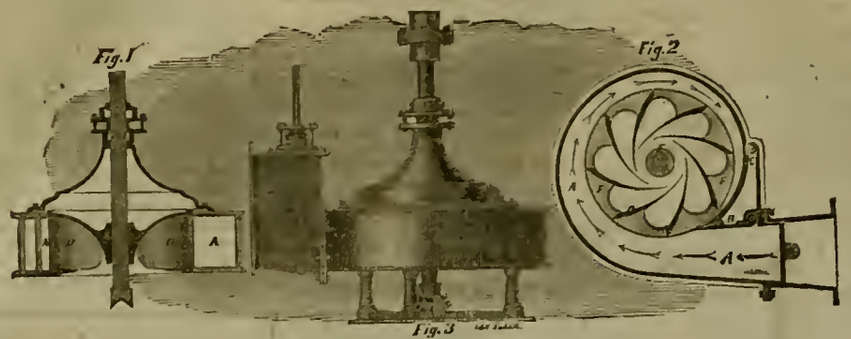
MR. SCRANTON, of Gold Run, Placer county, sends us a sample of antimony melted by himself from an ore of that metal, taken from a vein which he has located in Humboldt county, Nevada. This discovery is more fully described in our issue of the 2d instant.

MR. A. W. KING, who has recently returned from Mexico, has contributed for our cabinet quite a number of very fine specimens from the Concordia mining district, some sixty miles back of Mazatlan. The mines represented in this collection are the Cessandra, the Alacrans, the Arco, the Concepcion and the Napoleon. Each specimen presents quite distinct characteristics, evidently illustrative of the mine from which it is taken. Each of these mines was quite fully noticed by name, in our issue of last week. Some of the specimens are evidently very rich, chiefly in sulphurets of silver.

A VALUABLE CABINET.—We have received a call during the past week from Mr. M. J. Healy, an old resident of Dayton, Nevada, who has spent a large portion of his leisure time, during the last two or three years, in making a cabinet collection of minerals illustrative of the mineral resources of the State of Nevada and the adjoining territories to the eastward of the Sierra Nevada. We have not had the pleasure of examining this cabinet, but learn from the *Territorial Enterprise* that it constitutes one of the most extensive, varied and valuable cabinets of minerals ever brought together on the Pacific coast. This grand collection weighs several tons, and comprises from fifteen to twenty thousand different specimens. Mr. Healy leaves on the steamer of to-day for New York, taking his collection with him. He has also in course of construction a model of a stamp mill, with a grinding and an amalgamating pan, to be driven by a miniature steam engine, which will go forward by the next steamer. In order to better describe and illustrate the whole, Mr. Healy has also purchased the bound volumes of the MINING AND SCIENTIFIC PRESS for five years past.

MARINE RAILWAY.—The barque *Joaquin*, a New Grenada vessel of 600 tons, was put upon the marine railway of John G. North, at Point San Quentin, on the Potrero, last week, for repairs. This is the only marine railway in the city where steam is used to haul up vessels.

TYLER'S IMPROVED WATER WHEEL.



Power and Working Velocity, and Water required for these Wheels.

TABLE, showing the number of inches of water (miners' measurement) required to give one horse power, under heads from 3 feet to 100 feet, and the horse power of wheels of all sizes.

TABLE, showing the number of inches of water required for different sizes of wheels, from 9 inches to 48 inches in diameter.

TABLE, showing the number of revolutions per minute of different sized wheels, from 9 in. to 48 in. in diameter.

Head in feet.	Number inches water to one horse power.	Horse power of wheel 9 inches in diameter.	Horse power of wheel 14 inches in diameter.	Horse power of wheel 18 inches in diameter.	Horse power of wheel 24 inches in diameter.	Horse power of wheel 30 inches in diameter.	Horse power of wheel 36 inches in diameter.	Horse power of wheel 48 inches in diameter.	Inches water for wheel 9 in. in diameter.	Inches water for wheel 14 in. in diameter.	Inches water for wheel 18 in. in diameter.	Inches water for wheel 24 in. in diameter.	Inches water for wheel 30 in. in diameter.	Inches water for wheel 36 in. in diameter.	Inches water for wheel 48 in. in diameter.	Revolutions of wheel 9 inches in diameter.	Revolutions of wheel 14 inches in diameter.	Revolutions of wheel 18 inches in diameter.	Revolutions of wheel 24 inches in diameter.	Revolutions of wheel 30 inches in diameter.	Revolutions of wheel 36 inches in diameter.	Revolutions of wheel 48 inches in diameter.	Revs. of wh'l 40 in. in diam.

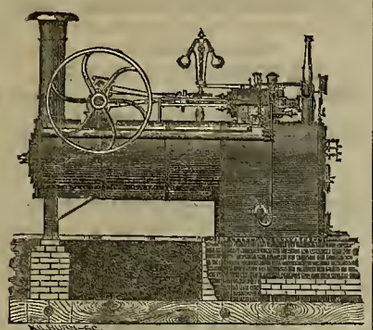
Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

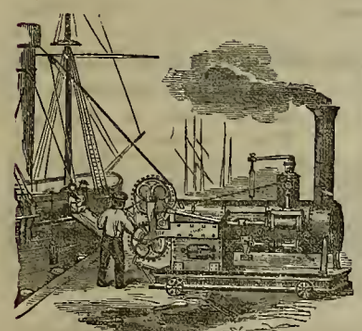
FOUR SIZES,

8, 10, 12, and 15-Horse Power,



HOADLEY'S.

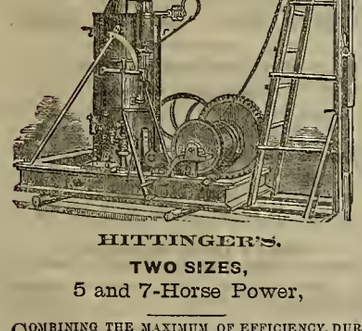
3 to 40-Horse Power.



HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power



HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURability, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mill's.

For sale by TREADWELL & CO.,
18vI2 Corner of Front and Market streets.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MURPHY.

MONEY BY MAIL.—Subscribers and advertisers remitting us money in less sums than $50, can do so by mail at our risk, if they will register their letters; we will take no risk on unregistered letters, or letters by express. Remittances by express must be prepaid

THE FIRST PRAYER IN CONGRESS.—The following is the first prayer made in the old Continental Congress, in 1777, by the Rev. Jacob Duchet, then rector of the Christian Church, Philadelphia: "Be thou present, O God of wisdom, and direct the counsels of this honorable assembly; enable them to settle all things on the best and surest foundations; that the scene of blood may be speedily closed; that order, harmony and peace may be effectually restored, and truth and justice, religion and piety, prevail and flourish among the people. Preserve the health of their bodies and the vigor of their minds; shower down on them, and the millions they here represent, such temporal blessings as Thou seest expedient for them in this world, and crown them with everlasting glory in the world to come. All this we ask in the name and through the merits of Jesus Christ, Thy Son, our Saviour. Amen."

VALUABLE MINES!

FOR SALE

IN NEVADA COUNTY.

FOUR VALUABLE QUARTZ MINES, SITUATED AT THE base of Deer Mountain, and about equi-distant from Grass Valley and Nevada City, are now offered for sale These ledges run parallel with each other, are wide and well defined, varying from fifteen inches to four feet in width, and have been sufficiently developed to prove them to be of great prospective value. One of them is an extension of the famous Star Spangled Banner. A shaft has been sunk on the extension to a depth of thirty feet, where the ledge is fully two feet wide, and prospects quite as well as the Banner did at that depth. On account of water, further progress downward was impossible without machinery. These claims are accessible at all seasons of the year, and wood and water exist in their immediate vicinity in great abundance. Parties who would prefer putting up machinery and sinking on one or more of these claims, for an interest in them, can do so, and liberal terms will be granted by the present owners.

Persons desiring to purchase claims, or erect machinery to prospect the same, will find this a capital chance. For further information, reference may be had on application to the Editors and Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 21v12

Eyes! Eyes!! Eyes!!!

DR HENLY, OCULIST AND AURIST, HAS received from Scotland one of the most miraculous remedies for the benefit of the human eye ever before discovered. It is unparalleled in its effects upon the diseases incident to this organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all mucous film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the Eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.

Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and if I do not give them relief in a short time, I WILL NOT CHARGE THEM ANYTHING. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco. 22-v12

The first bonnet worn in England was brought from Italy in the reign of Queen Elizabeth, and its form was a compromise between the pres- ent Italian peasant hat and the French hood. The materials employed in constructing these head ornaments were crimson satin, elaborately embroidered, cloth of gold, and similar rich materials. The Leghorn hat, with perpendicular crown and wide brim, standing out far round the face, was the first legitimate bonnet worn, and this appeared long after Queen Elizabeth's time. It was trimmed with artificial flowers and immense bows of ribbons.

A Great Cavern under Lancaster, (Pa.) Strong proofs are adduced of the existence of a vast though unexplored cavern beneath the city of Lancaster, Pa. In sinking wells, the bottom crust, which is limestone, breaks through before reaching the water, and the pumps are suspended from above by chains. There are also authenticated cases of the earth in the neighborhood of the place breaking through and engulfing farm animals. Shocks like those of an earthquake have been felt. These are curious stories, which are given for what they are worth.

Nevada and Grass Valley.—The assessable property of Nevada city is about $1,000,000, while that of Grass Valley will be in the vicinity of $2,000,000. So say the officials engaged in collecting statistics.

It is said that the cabbage seed gathered from the middle flower stem produces cabbage for use a fortnight earlier than those from the lateral flower stems.

The St. Louis *Dispatch* asserts that pilots on the Missouri River get from sixteen to eighteen hundred per month at present.

Conscience.—A tender conscience is like the apple of a man's eye: the least dust that gathers into it affects it painfully.

The quantity of maple sugar returned in Ohio in 1864, was 6,785,178 pounds.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting express lines in the interior make additional charges, subscribers must themselves settle the same.

Occidental Homestead ASSOCIATION,

Office, 305 Montgomery street, San Francisco.

Capital Stock : : : : : : $33,600

102 Shares, $33 Each.

THIS ASSOCIATION was formed to enable its members to obtain desirable homestead lots in this city, at a cheap and easy rate, paying for the same by regular monthly installments. For this purpose they have purchased blocks 499, 500, and 501 in the Western Addition to this city, bounded by Devisadero, Pine, Broderick and Clay streets. Subscribers will pay an initiation fee of $5 on each share taken, to form a fund for defraying current expenses, and $11 per month for thirty months, commencing in April, 1866. The property is within three blocks of the Turk Street Railroad, is nearly all on the grade, and is most desirably located for homestead purposes. It is directly east from the lands of the California Homestead Association. The property has been purchased on very reasonable terms, and offers a rare opportunity for investment. A number of fine houses are in process of erection, and streets are being graded near this property, which will greatly increase its value.

When twelve monthly payments have been made, the property will be divided among the members in the usual manner, and each shareholder will receive a contract for a deed to the lot or lots to which he may be entitled, and have the privilege of taking immediate possession of the same. The lots average 27 feet in front by 120 feet in depth. The whole amount due upon any lot may be paid at any time, and discount at the rate of 1½ per cent. per month will be deducted therefrom. Persons wishing to visit the lands of this Association will take the Turk street cars to Devisadero street, and thence go northerly along Devisadero to Pine street.

$20,000 of the capital stock is taken, and the books are open for subscription to the balance, at the office of the Secretary, where the Official Map of the Association can be seen, and all particulars obtained.

The Title to this property is perfect.

J. S. LUTY, Secretary.

Office 305 Montgomery street, corner of Pine, Rooms 2 and 6. 20v12-tf

Pacific Mail Steamship Co's THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

Rheumatism!!

READ IT! READ IT!!

SACRAMENTO, April 16th, 1866.

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITing I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial.

Yours truly, GEORGE TAYLOR.

☞ RICHARDS' REMEDY is for sale by

H. BOWMAN,
Druggist, Sacramento.

Price, $2 50 per Bottle. 20v12

Capitalists, Attention!

QUARTZ MILL & MINING PROPERTY FOR SALE In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam-power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price.

Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear rigid scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 22v12

The Great Pain Annihilator.

DR. E. R. JOHNSON WILL WARRANT TO CURE ALL cases of Asthma, Fever and Ague, Catarrh, Sore Throat, and Womb Diseases. The Doctor's success is miraculous in cases of RHEUMATISM, NEURALGIA, CONSUMPTION, GOUT, PARALYSIS, INFLAMMATION OF THE EYES, and all other diseases that human skill can reach. Rheumatic Pains removed in five minutes. Some of the afflicted that visit him come from one to six hundred miles, and soon find relief. Persons at a distance can be cured at home by addressing a letter to Dr. Johnson, No. 700 Market Street, San Francisco, stating case, symptoms, length of time the disease has continued, and have medicine promptly forwarded to any part of the country, with full and plain directions. ☞ Consultation by letter or otherwise, FREE. 15v12 1m

Aod in accordance with law, and an order of the Board of Trustees, made on the 10th day of April, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 620 Montgomery street, San Francisco, California, on Wednesday, the 13th day of June, 1866, at the hour of 12 o'clock M. of said day, to pay said delinquent assessmeot thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House. my26

Yankee Blade Mining Company, Reese River Mining District, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of May 1866, an assessment of twenty-five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 329 Montgomery street, San Francisco, Cal.

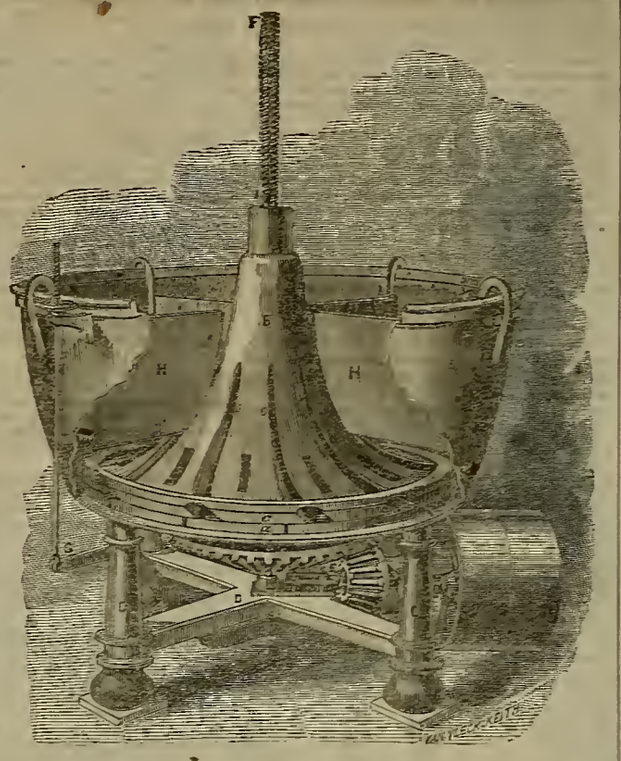
Any stock upon which said assessment shall remain unpaid on the 18th day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the ninth (9) day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. T. ATWOOD, Secretary.

—Office, No. 329 Montgomery street, San Francisco. my19

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings.



The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

GYPSIES.—The Massachusetts *Ploughman* says that there is a band of about one hundred gypsies located on the dividing line between Cambridge and Somerville, Mass. They obtain their living chiefly by dealing in horse flesh, although some of the women gather considerable money from the credulous by telling fortunes. The band is regularly organized and governed by a queen, who was appointed some two years since for a term of seven years. She is married and has one child, and lives in great luxury compared with the style of her subordinates. Since their sojourn in Cambridge they have had a beautiful chariot built for her accommodation. The interior is provided with a bed upon which the queen can recline while traveling through the country, and there are also apartments provided for her husband and child.

TO HAVE SUNSHINE IN THE HOUSE.—Put the children to bed *early*, with light suppers, that they may sleep well. They get up bright-eyed, clear-headed, sweet-tempered with sunlight on their countenances. The effects are magical. So writes one who has tried it. She says that with well rested brains and limbs she does more in twelve hours than she used to accomplish in eighteen, and finds far less friction in the household movements now than then. She finds her own feelings and spirits are contagious. Try two extra hours of sleep for a week, and note the results.

FRENCH IRON CLADS.—It is said that an alarming discovery has been made at Toulon where the iron-plated frigate Province is undergoing repairs, which shows the danger that menaces the entire iron-coated fleet of France. the Province was fitted out for sea only fifteen months since, and already a great number of her plates are nearly consumed with rust. The Director of Naval Architecture is of opinion that if a composition be not discovered to prevent the action of rust, the iron-plated fleet must be renewed every five years.

Machinery.

SAVE YOUR MONEY AND BUY,

For $100!

HUNTER'S

Premium Concentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY IMproved and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 125 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent. more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 113 Washington street, below Davis, where ALBERT JACOBS will fill their orders promptly.

13-v12

BAUX & GUIOD S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD S Pan, are the following: The trifling cost for attendance. Its small cost: Its portability: The large quantity of pulp it can operate upon in a given time: It may be worked even weeks without stopping, as it is constructed to work continuously: The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them: They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county: The French Mill, Nevada City: Cluff's Gravel Cement Works, Nevada county: Waltman's Chlorination Works, Nevada, Cal.: Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Keugh & Tom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6tf

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

HUGO HOCHHOLZER,
Virginia City, Nevada.
13v11-tf Through Wells, Fargo & Co's Express.

19v12 tf SACRAMENTO, CALIFORNIA.

A RARE CHANCE FOR INVESTMENT.

THE PATENT RIGHT FOR SALE

FOR STATES, TOWNS AND COUNTIES.

For the Best Chimney Top

Ever invented. Numerous testimonials from Proprietors of Factories, Foundries, Steamers, Hotels, etc., can be shown, attesting to its usefulness in creating draft, saving the expense of high chimneys, and a great saving of fuel.

Pamphlets containing descriptive drawings and testimonials will be sent free, upon application by letter or otherwise to the patentee,

B. A. HENRIKSEN,
Or J. E. JORGENSEN.
12v12 3m No. 226 Kearny street, San Francisco.

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST ERECTed, in this city, on Fourteenth street, near the Machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice all kinds of heavy forgings, car axles, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,
San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

FLORENCE
SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO THE—

Florence Sewing Machine Company,

FOR THE BEST FAMILY SEWING MACHINE.

HICHEST PREMIUM—COLD MEDAL!

REASONS:

1st.—Its simplicity and great range of work.

2d.—The Reversible Feed Motion.

3d.—The perfect finish and substantial manner in which the machine is made.

4th.—The rapidity of its working and the quality of the work done.

5th.—The Self-adjusting Tension.

The "Florence" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double thread Sewing Machines were exhibited in competition in 1865.

The "Florence" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "Florence" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

SAMUEL HILL, General Agent,
20v12-14w 111 Montgomery street, San Francisco.

Hungerford's Concentrator!

—FOR—

SAVING GOLD, QUICKSILVER,

—AND—

SULPHURETS.

MORGAN HUNGERFORD HAS MADE IMPORTANT improvements on the original Hungerford & Prater Concentrator, whereby the construction of the machine is simplified, and its operations rendered more complete and easy. It is made more effective by being self-discharging, and delivering the sulphurets more free from sand and dirt.

The Machine can be seen in operation at the Miners' Foundry, 21 First street. Call and examine for yourselves before accepting the opinions of persons more or less interested in other machinery.

Hours from 10 to 12 M. and 1 to 3 P. M.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

The new Concentrator will soon be illustrated and described in the Mining and Scientific Press.

Address: M. HUNGERFORD,
22v12-tf Miners' Foundry, San Francisco.

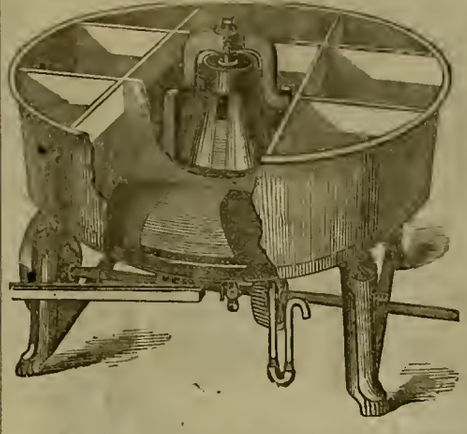
Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of EIGHT YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

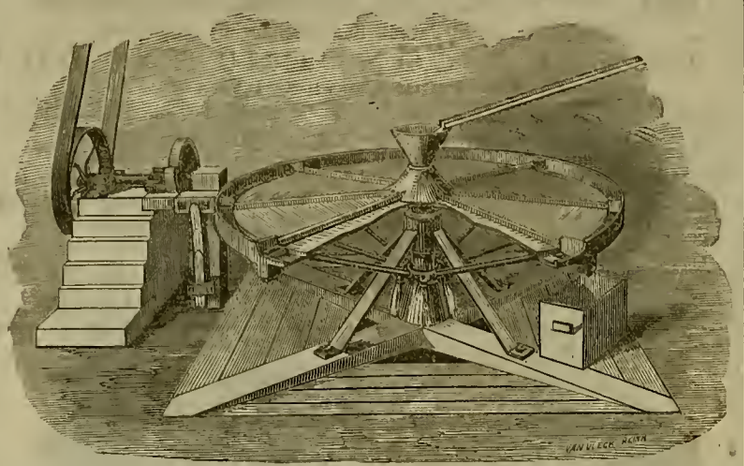
3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

☞ For further particulars, inquire of ISRAEL W. KNOX, OR
W. A. PALMER, Inventors,
14v13-p12-j At the Golden State Iron Works, No. 19 First street, San Francisco.

VARNEY'S CONCENTRATOR,



With a disk 4 1-2 feet in diameter—total weight of Machine 350 pounds.

Is driven by one-eighth of a horse-power, and will concentrate eight tons of ore per day, and make the sulphurets clean. Larger ones do work in proportion to size.

REMINGTONS'
ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a top STRAP or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

ALBERT E. CRANE, Manufacturers' Agent,
16v12 310 Washington Street, up stairs.

NEW MINING PUMP.

Excelsior Double-Acting Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam-power.

No. 1—Cylinder 2¾ in., stroke 6 in.
No. 2—Cylinder 3 in., stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No. 5—Cylinder 6 in., stroke 18 in.
The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,
12v12-3m 120 Front street,

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

LEFFEL'S
American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

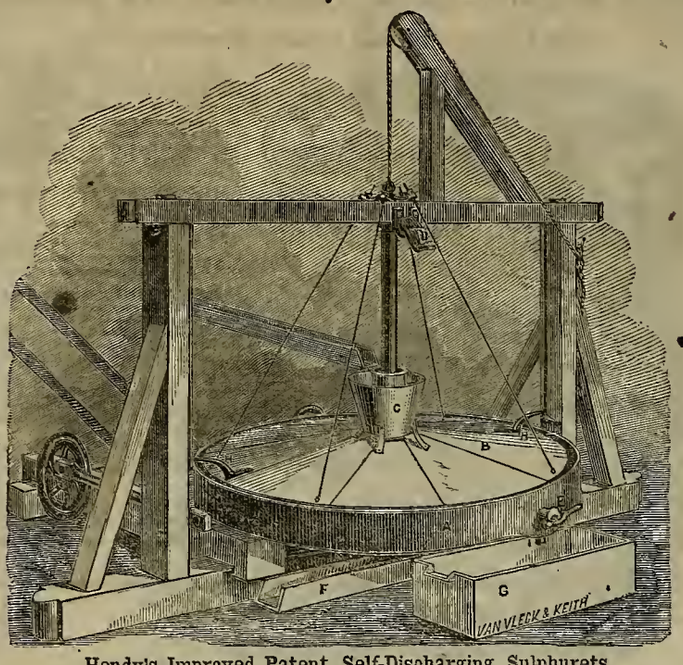
NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " " "
U. S. REESE RIVER MILL, Austin, " "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
OPHIR G. & S. M. CO., Newcastle, Placer County.
CONEY MILL, Jackson, Amador County.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:

One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Eight Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Hodge & Bro, San Francisco.

They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

California Academy of Natural Sciences.

REGULAR MONTHLY MEETING.

Monday Evening, June 4, 1866.

President in the Chair—eleven members present. Minutes of last meeting read and approved.

Donations to Cabinet.—Specimens of copper ore from Santa Clara county, and specimen of molybdenite from Coloma, El Dorado county, presented by Mr. Hanks; Land, fluviatile and marine shells collected in Nicaragua, at Panama, and in South America, by the late Thomas Bridges, presented by Mrs. Bridges; Mediterranean and Phillipine Islands shells, and two specimens of California birds, presented by Mr. Lorquin; Australian plants presented by Dr. F. Mueller; Lichens collected at Plover Bay, presented by Mr. Dall.

Donations to Library.—Publications of European Societies, through the Smithsonian Institution.

Messrs. Frederick Gulzkow, T. T. Gardner, Hugo Hocholzer, C. W. Lightner, Charles Bonner, W. A. Goodyear, Theodore Blake and C. R. King, were elected resident members.

Messrs. W. S. Keyes, E. B. Dorsey, W. W. Palmer, M. L. Stangrom, W. J. W. Harford, James T. Watkins, Jr., and Ferdinand Richthofen were proposed for resident membership

Mr. Dall stated that in the month of January last he visited Monterey for the purpose of collecting the shells of that locality; as the result of two weeks unremitting labor he succeeded in obtaining, without the use of the dredge, 219 specimens, by far a larger number of species than has heretofore been obtained by any other person.

Professor Whitney made some remarks on the absence of the Northern drift formation from the region west of the Rocky Mountains. It was shown that the observations of all geologists who have traversed the country west of the Missouri, agree in proving the entire absence of anything like Northern drift in the region in question. The explorations of the Geological Survey, and of Messrs. Gabb and Ashburner, in Oregon and British Columbia, as also those of Dr. Hayden in the Rocky Mountains, and Mr. Dall in Russian-America, were referred to in this connection.

The importance of the facts thus set forth in their relations to those of different geologists was commented on; Professor Dana's views on the formation of fiords were also obtained. Professor Whitney remarked in closing that he would, at a future time, take up this subject and treat it in a more thorough manner, as it is one of great theoretical interest.

Messrs. Whitney, Ashburner and Stearns were appointed a Committee to select periodicals to be subscribed for by the Academy.

Adjourned. H. N. Bolander, Secretary, *pro tem.*

Copperas.—Mr. Benj. Brady, 103 California street, advertises 200 barrels of copperas, sulphate of iron, for sale in lots to suit. Farmers and others, who use this article, will do well to call as above.

EXCELSIOR PUMP—HOOKER'S PATENT.

We give annexed an illustration of the "Excelsior Challenge Double-Acting Force Pump—Hooker's patent"—a California invention of very superior merit; pronounced so both by competent mechanics, and by numerous parties who have had practical experience in the use and durability of the same. As a

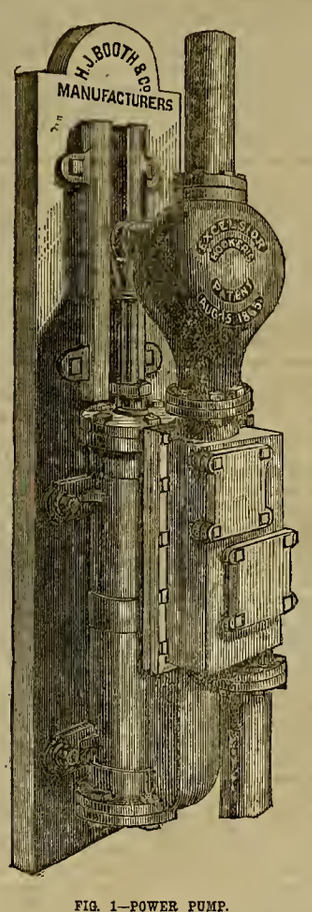

FIG. 1—POWER PUMP.

most important evidence of the value of this pump, we may state that the California Steam Navigation Company have selected it for their new and splendid steamer "Capital." The proprietors claim for it, and advertise that they will warrant that this pump will raise more water than any other of equal size, driven by the same power. It is readily placed in position; its valves are very simple in construction, so much so that it is said to be almost impossible for them to get out of order, while at the same time, the pump can be run at a very high rate of speed, which quality gives it a great advantage as a fire engine. These pumps are strongly and substantially made, and especially adapted for deep mine work. Some of them are now at work at a depth of 400 feet in the mines. By a careful inspection of the accompanying illustrations, it will be noticed that the valve chamber may be readily approached for repairs, examination or removal, by simply removing a "bonnet." Mechanics who have used other force pumps, will readily appreciate the great advantage to be derived from this arrangement.

Fig. 1 shows a power pump for mining or other heavy work, while Fig. 2 represents a hand pump for domestic purposes. All sizes on hand and for sale, adapted to any power; brass pumps for ships and steamers. Messrs. J. W. Britton & Co., 120 Front street, are agents, who will furnish any size pump and the proper fittings. Messrs. H. J. Booth & Co., Union

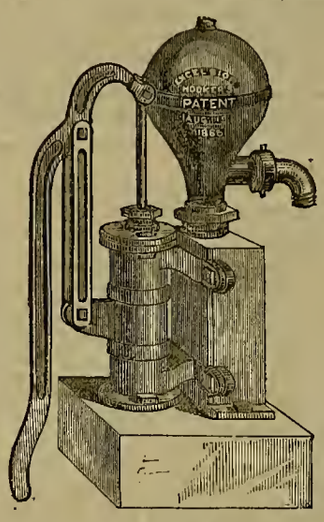

FIG. 2—HAND PUMP.

Works, First street, manufacture and sell these pumps. Liberal discounts always made to the trade. For further information, or for circulars, address through the post office, V. Cushing & Co., proprietors.

Origin of the Ague.—A new vegetable production had recently been discovered, and named the "ague plant." This is not a plant which cures the ague, as might be expected, but one that causes it. This plant is very minute, and it requires a good eye, aided by a good microscope, to find it; but when found, it cannot be said that it is "no great shakes," for it is the "genuine Shaker seedling" itself. Dr. Salisbury, of Cleveland, Ohio, announces in the *American Journal of Medical Sciences*, that fever and ague is caused by a minute plant, which is found where stagnant water has just dried away. The spores, or reproductive dust of this microscopic plant are diffused through the night damps, and being inhaled are the cause of that wide-spread disease—the ague. The habits of these minute plants completely accord with what was before known of the occurrence of miasma, and that they are the real cause of it has been shown by taking boxes of earth containing them to places where an ague was never known to occur. In about two weeks after the ague plant was taken there, well-marked cases of the disease appeared. The spores only rise in the night, and then to a hight varying with the locality, of from thirty to one hundred feet. This explains why night air brings on ague, and why elevated localities are free from it. After the ague is taken into the system the plant is propagated there, and the patient becomes a sort of animated hot bed.

MINERAL CURIOSITIES OF COLUSA COUNTY.

A rather curious combination of minerals is found in a claim known as the Manzanita mine, on Sulphur Creek, in Colusa county, about fifty-six miles due west from Marysville, and ninety-five from Sacramento, in the Coast Range of mountains. The first is a very rare specimen of *native gold* in cinnabar. This, we believe, has never been found before in California, except at this mine (although gold has been found in the slag of the New Almaden cinnabar mines, in Santa Clara county). At the Manzanita mine is also found a variety of limestone, in which free gold is plainly visible, and also bitumen in the same rock. There are also other rocks containing bitumen, as well as good indications of copper in this mine. Then there is quite a variety of salts, in solution, dripping from the rocks—copperas, arsenic, magnesia, and other salts. This, we think, constitutes the greatest variety of minerals ever found in one short tunnel of about ninety feet long by four and one-half feet wide

In front of this tunnel and in the creek, a few men worked and washed the gravel, and took out therefrom $300 in free gold and a quantity of cinnabar, from which was extracted about $300 worth of quicksilver. A short distance below this is another mine, known as the Oriental, where cinnabar, petroleum and bitumen are found in the same rock. The rocks in this vicinity seem to be of a volcanic nature, showing there has been great heat at some time in the past.

A short distance below this is quite an extensive sulphur mine, from which is now being taken large quantities of native sulphur of a good quality. There is also below this one or two places where boring is going on for oil, with good prospects, and now only waiting for more extensive machinery. There are, near by, three of the most valuable sulphur springs in the State, for the cure of rheumatism, and other diseases. These celebrated springs are well known as Simmons and Clark's and Wilber's Springs. At Wilbar's Springs a very remarkable gas spring is found, which has been burning for a number of months, and at times throws up a flame two or three feet high and three or four inches in diameter. There are also numerous other strange curiosities up and down this creek, which must be seen to be appreciated. Stages run from Colusa, in connection with the stages from Marysville, almost every day.

Emigration Across the Plains.—Reports from the East state that the emigration across the plains to California, for the present season, will not be so great as generally expected. Montana and Idaho are absorbing a large portion of the emigrant trains; while the intervening States and Territories are offering such inducements that thousands from the Eastern States, who had contemplated a trip across the plains, have concluded to set down in Missouri, Nebraska and Kansas. The lead mines and agricultural resources of Missouri are more inviting to many than the more distant gold and silver mines to the east of the Rocky Mountains. An accession of fully 10,000 voters is counted on for the State of Missouri.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Clear Creek Mines, Kern County.

BY OUR SPECIAL CORRESPONDENT.

[Continued from Page 354.]

EDITORS PRESS:—The first mill erected in the Mount Sinai district was that of the Pettis' Gold Mining company, who put up a "patent crusher," imported from Boston. This proved a failure, and the mill is now idle, but it ran long enough to prove the richness of the rock, and the owners intend replacing it with a stamp mill this summer.

Mr. R. H. Rogers, of San Francisco, has purchased, conditionally, some twenty or thirty claims, including one or two locations on the Antelope vein. He was putting up a 5-stamp mill for the purpose of testing them, which is probably running by this time. It is driven by a "Hoadley" portable engine of 15-horse power, and is erected in the most thorough and substantial manner.

The Olanche Silver Mining company, Mr. Farleigh superintendent, were engaged building a saw-mill, which they expected to have in successful operation in a few days. They have a 40-horse power "Little Giant" engine, and intend adding an 8 stamp battery for quartz, as soon as their saw-mill is fairly under way.

In the afternoon the whole party rode out to the Pi Ute district, situated in a range of slate formation, some three miles west of Claraville. This district is as yet entirely undeveloped. Though several fine-looking veins have been discovered which prospect well, none of them are opened more than three feet deep; yet, in this undeveloped condition, one of them, the Cherokee Dick ledge, which is nineteen feet wide on the surface, has been sold for $50,000, of which $600 was paid down to bind the bargain. The veins in this district run across the strata of the slate, are very well defined, with distinct and regular walls.

The next morning Mr. Burke and myself started for Walker's Basin, where we arrived about two o'clock. Four miles further, over a gently undulating country, covered with a scant growth of timber, we alighted at the famous

JOE WALKER MINE,

In what is called Quito Mining District, eight miles south of Havilah. The mine was located on the 20th of March, 1866, by Mr. Hamp Williams, by whom it was sold to Messrs. Burdett and McKidney, who afterwards sold a third interest to Mr. E. R. Burke, the present superintendent. At the time of my visit, a large, well-timbered shaft was down sixty-five feet on the vein, and the workmen were preparing to drift. The formation of this district, like that of all others south of the Kern River, with the exception of the Pi Ute, is granite. The course of the Walker vein is northeast and southwest, with a slight dip to the southeast. The narrowest point in the vein yet opened is three feet eight inches, and its breadth varies from that to seven feet, probably averaging from four to five feet. The walls are very regular and smooth, with a tough clay "gouge" on the foot or western wall. The rock throughout prospects well. The owners of this mine have secured some 1,500 acres of timber land, which will furnish them with wood for many years. Some other veins have been discovered in this district, but they are generally small, and no work has been done on any of them.

On the following morning I set out in company with Mr. Ostrom, of Havilah, to visit the mines in Cottonwood and Agua Caliente districts.

COTTONWOOD DISTRICT

Is located in the foot-hills east of Agua Caliente Basin, twenty miles southeast of Havilah. The formation and appearance of the country are quite similar to that of the Quito district. The veins in this district have been discovered and located by persons in the employ of the Enterprise Prospecting Company, composed of seven of the citizens of Havilab, in whose employ Capt. Titcomb and party have been traveling and prospecting for five months past. In this district this company own ten lodes, besides valuable locations elsewhere. At the time of our visit Capt. Titcomb was at work prospecting the Keystone, the largest and most promising of the company's claims in this district. The rock prospects quite well. There are no mills, arastras, or other means of crushing rock in this district. At the invitation of Capt. T. and Mr. Kelly we spent the night at their camp, and in the morning set out for the

AGUA CALIENTE DISTRICT,

Distant about three miles in an easterly direction. This district was discovered several years since, and over one hundred ledges have been located. A mill of five stamps, with engine of 30-horse power, well and substantially built, was erected some years since, but on account of miserable management proved a failure. It is expected to start it again this summer, under the management of Judge Walsh, the well-known prospector, and with fair reason to expect success. Several arastras have been running for the past year with very good success, and the hopes of the miners in regard to the district are very high indeed. I visited several veins, but few of which had been opened to any extent; but as far as opened many of them showed flattering prospects. One in particular, the Monarch, is from six to seven feet wide, and the surface rock prospects finely. All the others that I visited were small, but several of them prospect very well. I was informed that in the upper part of the district there were several ledges of equal size and prospects with the Monarch, but want of time forbid my visiting them. This district is well supplied with wood, and has sufficient water for steam and amalgamating purposes. I started on Monday morning for Keysville, on Kern River.

The most important enterprise in this district is that of the

MAMMOTH GOLD MINING COMPANY,

Who purchased the celebrated Mammoth lead, situated in a hill just back of the Keysville. This vein has been worked on the surface for over 2,000 feet, and immense quantities of gold taken out, but from some cause its owners have never managed to make it profitable. The present owners are erecting a 20-stamp water-mill, under the superintendence of Mr. McClellan. By the politeness of Mr. O. A. Sanborn, one of the present proprietors of the mine, I was shown the works. An old tunnel started by those who formerly worked the mine has been re-opened, and extended until it is now 440 feet into the hill, following the vein the whole distance. The course of the vein is northeast and southwest, with a slight dip to the southeast, and throughout this tunnel it varies in width from one to six feet, averaging three and a half; though in some places, in the upper works, the vein appears to have been much wider. A parallel tunnel, 130 feet below the old one, has been started by the present proprietors, and driven in a distance of 130 feet, but has not yet cut the vein. It is estimated that this tunnel will open the lead to a depth of 500 feet. After dinner I pressed on up the mountains some ten miles, to the

GREEN MOUNTAIN DISTRICT,

Situated on the summit of the western range of the Sierras, here known as Greenhorn Mountain. This district is the best supplied with timber and water, and possesses the most beautiful scenery and the finest agricultural lands of any mining district I have visited south of Visalia. The only mines in operation here at present are a series of ledges now owned by White & Butterfield, of San Francisco, and formerly by the Hudnatt Bros., who have been living in the district for the past ten years. The principal of these is that known as the Rough and Ready, which was opened by the former owners to a depth of 180 feet; but the works having been filled up by the floods of 1861–2, it had been abandoned until it came into the hands of the present owners, who have sunk on the vein to a depth of sixty-five feet, re-opening some of the old works, and showing the ledge with an average width of one foot. I was informed by Mr. Hudnatt that the rock from the old works had all paid from forty to ninety-six dollars per ton in arastras. Besides the R. and R., Messrs. Butterfield has also purchased the United States, Frenchtown, and several other promising veins. After spending the night and the forenoon of Tuesday with the hospitable miners of Greenborn, I set out for Long Tom, distant about sixteen miles in a northwesterly direction. The principal mine of this district is the

LONG TOM MINE,

Owned by Geo. D. Roberts & Co., who purchased it about a year since of the original locators, who discovered the vein about three years ago, and had been working it with arastras for about two years. The ledge is in granite, running northeast and southwest, and dipping to the westward at an angle of thirty degrees. It is opened to a depth of 110 feet by two shafts, from one of which the rock is hoisted by horse power with a whim, no water having yet been struck. The average width throughout these works is from six to seven feet. A 10-stamp mill, driven by a 20-horse power engine, built at the Miners' Foundry, is erected three-fourths of a mile below the mine. It is built after the Grass Valley style, with Attwood amalgamators, etc., and is capable of reducing twenty tons of quartz daily. From thirty-one days' run of this mill Mr. Roberts informed me that they have cleaned up $28,000 in gold, a result which they think the present run will largely improve upon, as they are now working what they consider much better rock. I spent the night with Mr. Roberts, and in the morning left for White River, where I arrived late in the evening. Directly at the village of White River is the mill of the

WHITE RIVER MINING CO.,

Of eight wooden stamps, driven by water-power, and capable of crushing four tons of quartz daily. It was employed on rock from the Josephine mine, situated some three miles distant, and which pays from seventy to one hundred dollars per ton. The whole affair is very crude, but as the rock is rich and easily worked it pays very well. The company own several veins, of which, however, the Josephine is the most thoroughly opened, and appears to be most valuable.

Half a mile below the village is the mill of Fleck & Piatt, consisting of a jaw crusher and two arastras, driven by a turbine water-wheel. The crusher is the invention of Mr. Fleck himself, and was described in the issue of the PRESS published two weeks since, under the head of California patents. It is said to be capable of reducing four tons of quartz daily.

Four miles below the village is the mill of Mr. John D. Carter, superintended by Mr. Rivers. Mr. C. owns seven different veins, and has been trying to work them heretofore by means of a water-mill, consisting of a jaw-crusher, and some of Beath's and Howland's pans. This, however, did not succeed to his satisfaction, and he is now building a fine 10-stamp steam-mill, which looks considerably more like work. Mr. C. is also building a private telegraph line to connect with that leading from Los Angeles to Visalia, thus placing his mill in immediate telegraphic communication with San Francisco. After looking at the mill, and conversing with Mr. Carter for an hour or two, we rode out in company with Mr. Rivers to visit the mines of the district, most of which are located in a range of slate hills at some distance from the river. After visiting several of the veins belonging to Mr. Carter, many of which appear well on the surface, though but one has been opened to any great depth, we passed on to the Josephine, owned by the White River company, which being the most thoroughly opened, and probably the best mine in the district, I have selected it as a type, and will describe it more minutely. The course of the vein is northwest and southeast, parallel with the strata of slate, with a dip to the northeast of forty degrees. It has been opened about fifty feet deep, showing a chimney of pay ore from one to two feet wide, and about fifty feet long, pitching to the northwest. The rock from this chimney is said to pay from seventy to one hundred dollars per ton, and as the mine contains no water, and may be cheaply worked, it certainly ought to pay handsomely. The people of White River are sadly in want of a post office, but as it seems to have been heretofore impossible to find a loyal man who was willing to accept the position of postmaster, they have been unable to obtain the proper accommodations. It is to be hoped that the authorities will soon make the necessary arrangements, for the village is directly on the line of the present mail route from Visalia to Havilah, and a post office here would require neither expense nor trouble to the Government.

Leaving White River about two o'clock in the afternoon, nothing of special interest occurred until I drew rein under the shade-trees in front of Mr. Daley's quiet and home-like hotel on Tule River, twenty miles distant on the Visalia road. The Tule River valley is certainly one of the loveliest farming sections it has ever been my lot to look upon. The banks of the stream are very low, affording easy means of irrigation, while the broad oaks scattered over the country in every direction give it a cool and shady appearance very inviting to strangers.

Leaving the pleasant retreat at an early hour yesterday morning, I arrived in Visalia a little after noon, and am now enjoying comfortable quarters in the Visalia Hotel, where my friend Harland does all that is in human power to make me feel at home, and succeeds so well that I shall probably stay here for several days.

Yours wanderingly, D.

DESPISE none, however humble; the rudest stone in the quarry may yet become the capstone of a beautiful structure.

[Written for the Mining and Scientific Press.]

Sierra Buttes Quartz Ledges.

MESSRS. EDITORS: Through rain and snow your correspondent has penetrated the mountains, and visited these valuable ledges. They are situated on the slope of the Buttes about half way from the level of the river to the summit in Sierra county. The Buttes consists of a cluster of bald and rugged peaks that lift themselves high above the surrounding ranges at an elevation of about 11,000 feet above the level of the sea. Their snow-clad summits are visible for many miles, and a near view presents a vision of grandeur in mountain scenery unsurpassed by any part of the Sierras. Though many visions of great beauty are presented to the observer, it does not belong to us to enter into a description of them, but to the mining interest our present letter must be confined.

SIERRA BUTTES QUARTZ MINING COMPANY,

Situated on the southern slope, is the oldest and at present the most valuable of all the mines here. The distance from Downieville is fourteen miles. The mountains are so rugged that wagon roads thus far have been an impossibility, and all travel and transportation of goods have been by mules. The mine is known in the country here as the Reis mill, on account of its being owned mostly by the Reis Brothers of San Francisco. Mr. F. Reis resides at the mine, and is superintendent of the works. The ledge or ledges upon which the mine is located was discovered in 1852 by some one now unknown. It was first worked by Mr. Sol. Woods, who let it out to Spaniards to be worked on contract. With their inexperience it did not give the promise of its present permanence and value, and the gentleman named was induced to part with his interest at a nominal sum. Since then the present owners have steadily developed it to its present condition, that is, one of the best mines on the coast. On our arrival at the mine we were kindly entertained, and after a bountiful repast, guided by Mr. W. A. Farish, the foreman of the works, candle in hand, we entered the levels and commenced our tour of sight-seeing. We found the mine to consist of three ledges, well defined and valuable in mineral deposits. The ledges are named Cliff, Æriel and Rose. The Cliff and Ærial are nearly parallel, running west and joining in the center of the hill. The dip of these ledges is to the north. The Rose ledge runs northwest by south, cutting the other ledges at an acute angle. On or near these ledges three main tunnels have been extended with respective drifts and chambers intersecting the ledges. The upper, lower and middle tunnels have a total length of 3,300 feet, besides many uncounted extents in sectional tunnels. The distance between the upper and middle tunnels is 240 feet; between middle and lower 220 feet. Between the middle and upper tunnel upon the Rose ledge, a body of good ore has been struck 240 feet high, with an average width of twelve feet, upon which workmen are now engaged in breasting. This body has already been taken out a distance of 600 feet. In the middle lead, where the Ærial and Cliff join, a body of mineral is in sight, running in a westerly direction 200 feet in length, with a thickness of from ten to twenty feet. In the lower level, 220 feet below, and at a distance of 1,200 feet from the mouth of the tunnel, the same body of rock is met still striking down. On the same level, the Æriel, before joining the Cliff, discovers a streak of mineral 250 feet in length, with a width of from five to ten feet. The quartz in the Æriel and Cliff is of similar character, a milkish color interspersed with brown sulphurets, which hold great quantities of free gold; it is also streaked with lines of ribbon rock. The wall rock is talcosa slate, and the hanging wall in places shows greenstone. The quartz of the Rose ledge is of different character, of a reddish cast, containing bright sulphurets and streaked with verdigris. This is the best paying of all. While speaking of the ledges, I forgot to state that they increase in both richness and extent as they descend. Two mills of twelve stamps each are in constant operation, making runs averaging sixty days. No amalgamating pans are used, copper plates and blankets take their

place. The tailings are worked on shares by a party of Italians, who have erected seventeen arastras below the mill, and make about $12,000 per year. The mills are all below the levels, and the rock passes down a cut grade upon which cars are so arranged that the loaded one hauls the empty one again to the depot. I desire to render my thanks to the superintendent and foreman for their continued kindness and consideration shown me during my visit.

THE INDEPENDENCE MINE.

Just a mile north of the Sierra Buttes mine, is on the same ledge, and though lacking the development of the last mentioned, is giving evidences of richness and extent, promising much in the future. The ledge here extends east and west, dipping to the north at an angle of forty-five degrees. There are three tunnels, one main one, however, situated at the lowest point on the slope. In this tunnel about 600 feet from the entrance, a deposit of mineral is met, 400 feet long by 42 feet wide, and at a distance of 400 feet below the surface, at this point, the tunnel bears east back toward the entrance directly on the ledge, showing mineral 500 feet in extent and twelve feet in thickness. The tunnel at this point is eighteen feet wide by twelve high. From the lower to the middle level above, an immense chamber has been excavated in which the eastern and western walls are of good rock. Between the middle and lower level is an extensive deposit of quartz, 300 feet long with average width of eight feet. This runs west from the point where the lower tunnel turns east. The middle level is entered from the south by a tunnel cutting it at right angles. The level runs east and west. In the eastern section of this level a body of mineral 120 feet high by seven feet wide has been opened, though its absolute extent is not yet known. In every direction from the different levels many large chambers have been opened, and the visitor is struck with wonder at the amount of labor and the results. The chambers and levels were full of laborers, and the noise of hammers and click of picks made a fine chorus. The mine is very much troubled with water, great quantities entering the roof. The rock is so hard and firm that no timbering except in the chambers is necessary. There are two mills, having together thirty stamps; at present only one mill is in operation. In this mill the batteries contain twenty-four stamps (580 pounds); copper plates and blankets are used in place of amalgamators. The mill is driven by two water wheels 72 feet 6 inches in diameter, with three feet breast. The tailings from the mill are worked on contract by three arastras. The rock in the ledge is the same as the Sierra Buttes mine, containing a great quantity of sulphurets; galena in small quantities is sometimes found. The present indications are most favorable for the value and permanency of the mine. The ledge is a true fissure, and is constantly growing in extent. The runs are of sixty days length. The clean up in February last was $13,421, in April, $13,532; last year, $98,400. Mr. E. Suid, a gentleman in every sense of the word, is the superintendent, and Mr. Thomas Phillips, the energetic and efficient foreman.

THE PRIMROSE,

About four miles north of the Sierra Buttes quartz mill, is supposed to be on the same ledge, as the indications are the same. The ledge is a good one, in some places over fifty feet wide, and will average at all points twenty. The rock yields fifteen dollars per ton, and is easily worked; a blast in three feet will throw down, it is said, fifty tons of rock. A tunnel 1,000 feet long has been run, entered by a shaft 160 feet perpendicular hight. A great fissure cuts the ledge about 100 feet from the shaft, and seems to have been the place of some great thermal spring. The disorganized and irregular character of the ledge at that point is proof of such an hypothesis. No work is done at the mine on account of want of machinery, which want will soon be attended to and operations will commence. Mr. P. A. Lamping, the banker of Downieville, is one of the principal owners. The length of this letter compels me to cease, although half is not told. In another letter the other interests of this section will be noticed. W.

Sierra county, June, 1866.

THE SIAMESE TWINS, according to the Raleigh (N. C.) *Standard*, are quite outside by two fourteen-year old negro girls, born in Anson county, N. C. The connection between these girls is closer than in the Siamese twins, there being more of the physical and mental organs common to each. The connection begins below the neck and terminates at the extremity of the spine. To touch one at any point of her body below the connection sends a sensation to the brain of each; while a touch of either above the connection is felt by that one only; but they can talk on different subjects at the same time.

ADVICES from New Zealand report a destructive flood and hurricane at Auckland, April 1st.

Mechanical.

AN INVENTION WANTED.—If any civilized inventor will get up a device for shutting doors without slamming, he will confer a great benefit on those who adopt it. Not one in thirty-four—by count—takes the trouble to prevent the slamming of doors, however heavy they may be. Of course, doors that are shut by springs ought to be light; but that is not the fashion; so there is needed a device to shut an abominably heavy door gently, and hold it securely. Cushioning will mitigate the nuisance; but a better action of the spring is needed. We think it may be got up if attempted by an inventor of genius and taste.—*American Artisan.*

Mr. Benj. F. Barker, of this city, has made an invention which exactly meets the above want. The spring is entirely concealed in the wood-work of the door, so as to admit of its being used anywhere. It is so constructed as to operate as a support, instead of tending to draw the panellings apart as most springs do. It is easily applied to any door; is simple, cheap, durable, and not at all likely to get out of order. Its power is so distributed along the motion of the closing door, that a gentleman's hat, when placed against an open door, will hold it open; while it will immediately close upon the removal of the hat, exerting its action until the door is completely closed, which is done without any slamming whatever—the power being exerted precisely in proportion to the degree of resistance. A door was hung at the Pavilion with one of these springs attached, during the last exhibition of the Mechanics' Institute in this city, and elicited the highest commendation from house-builders and others, who, without exception, so far as we heard, (and we had a very good opportunity to notice), pronounced it superior to anything of the kind ever before exhibited. We believe the inventor is willing to part with a portion of his interest to any party who will undertake to manufacture and introduce it. If the *Artisan*, "or any other man," is anxious to learn further with regard to this invention, he can do so by addressing Benj. F. Barker, San Francisco.

SACRAMENTO UNION IRON WORKS.—Not long since, the proprietors of this foundry, Messrs. Williams, Heilbron & Co., erected a substantial brick structure in place of the old wooden building, which stood below the grade of the levee, on Front street, between N and O streets, Sacramento. The new building is 40 by 46 feet, and three stories in hight. The first floor is occupied as the engine and store-rooms; the second story comprises the machine shop; the third story and loft being used for pattern making and storage. Adjoining the shop the company have a new office, with commodious yard and blacksmith shop. This is one of the oldest foundries in the State. Its pattern list shows that a great variety and amount of work has been performed. The shop is at present crowded with work, including orders for an engine for the steamboat "Pet;" one 20-stamp quartz mill, with 12-inch cylinder engine; one 10-stamp mill with 12-inch cylinder engine; a 10-stamp mill and water-wheel, and a large amount of jobbing and miscellaneous work. We esteem our acquaintance with the gentlemen and mechanics who conduct the business of this firm, and can recommend them and their work. The present company is composed of Messrs. W. R. Williams, H. F. Root, and A. Nielson.

FARMING ENGINES.—The ranchmen of California are wisely introducing machinery to take the place of high priced manual labor. The Golden State Foundry have just completed two staunch and well-built portable engines for driving threshing machines. Each engine is rated at from 12 to 15-horse power; cylinder 7-inch diameter, and 14-inch stroke. The entire engine and fly-wheel are solidly united to the boiler, which is mounted on wheels. The boiler is of locomotive style, about 12 feet in length, and the weight of all is about two tons. These engines show good workmanship, and are said to be light and superior in adaptation to imported ones. We believe that portable engines similar to these may be used to advantage for prospecting purposes in our mines.

TO RENDER WOOD UNSUSCEPTIBLE TO EXPANSION AND CONTRACTION.—Mechanics, miners and others, are much annoyed by the swelling and contraction of wood, especially when used for axe and pick-handles, for wheel felloes, etc. A practical man, who has paid much attention to this matter, gives his experience as follows:

"I ironed a wagon some years ago for my own use, and before putting on the tires, I filled the felloes with linseed oil; and the tires have worn out and were never loose. I ironed a buggy for my own use seven years ago, and the tires are now as tight as when put on. My method of filling the felloes with oil is as follows: I use a long cast iron heater, made for the purpose. The oil is brought to a boiling heat, the wheel is placed on a stick, so as to hang in the oil, each felloe for an hour for a common sized one. The timber should be dry, as green timber will not take oil. Care should be taken that the oil be not hotter than a boiling heat, in order that the timber be not burnt. Timber filled with oil is not susceptible to water, and the timber is much more durable. I was amused, some years ago, when I told a blacksmith how to keep the tires tight on wheels, by his telling me that it was a profitable business to tighten tires, and the wagon-maker will say that it is as profitable to to him to make and repair wheels; but what will the farmer, who supports the millwright and smith, say?"

ELECTRICITY IN A COTTON MILL.—The Lowell (Mass.) *Courier* of March 23d, says: "It is a general truth that friction develops electricity, and most workmen know that a machine belt at high speed by its friction with the air is highly electrified. It has for years been a common experiment for a workman to light gas burners by holding one hand to a fast going belt and the other to the open burner. This matter was curiously demonstrated in the Appleton Mills of this city on Wednesday. A strong smell of fire being noticed, the premises were carefully searched, and a small quantity of cotton lint inside a belt casing, was found on fire. The lint lay upon a beam which was within four inches of a belt some fifteen inches wide and moving two hundred and twenty revolutions a minute. In the beam was an iron bolt, the head of which was toward the belt. From the belt to the bolt was passing a stream of electric sparks, which had set the cotton lint on fire. After attending to this case Mr. Motley, the agent, opened the casing of a similar belt in another mill. The beam in this case was fourteen inches from the belt, but the stream of electric sparks was at once seen jumping across the beam, although it had not set fire to anything. Perhaps some of the cases of fire from supposed 'spontaneous combustion' are due to electricity from machinery. The subject is an interesting one for investigation, and probably a profitable one."

THE largest marine steam cylinder ever cast has been turned out successfully by John Roach & Son, at the Ætna Iron Works, New York city. It is 112 inches in diameter, and 12 feet length of stroke, and is for the new steamer Bristol, building for the Sound service. The triumph of American skill gives but another proof of our advancement in the manipulation of iron in this country. We have produced the largest wrought-iron solid fly-wheels, shafts, composition screw propeller, guns, and now the king of all steam-cylinders. With this cylinder on end, a round table placed in its center, would accommodate about thirty people.

The above cylinder is but two inches larger in diameter than the cylinders used in some three or four of the Pacific Mail Steamship Company's boats, and the length of stroke the same.

MAGNESIUM.—M. Deville lately communicated to the Academy of Sciences at Paris, the fact that magnesia, obtained by calcination from chlorida of magnesium, will, when exposed to the action of water for some months, acquire considerable consistency, and become hard enough to cut marble. A lamina of this magnesia of moderate thickness, is translucid like alabaster. With this substance M. Deville has been enabled to take casts, as if with plaster of Paris, only the former sets under water. A mixture of chalk and magnesia, in powder, made up into a paste with water, is good for molding, and will become exceedingly hard under water.

DESULPHURIZING ORES.—Messrs. Tait and Avis, of New York, have patented the process of desulphurizing sulphurets by a current of heated compressed atmospheric air, impelled by a suitable pump, in combination with a closed furnace containing the ore. Also the use in this process of nitric oxide gas in combination with the atmospheric air; also with the use of steam in combination with the heated air.

COMPRESSED AIR.—Compressed air, as a motor and medium for ventilating mines, has now been brought into practical and successful operation, and the day cannot be far distant when it will be in general use. Compressors are manufactured in this city, with which a pressure up to 220 pounds is readily attained. Practice at the Mount Cenis Tunnel has demonstrated that at the distance of two miles from the air receivers the loss of power is less than five per cent. In several places in Europe machinery in mines is driven by compressed air, which, when exhausted, cools and purifies the atmosphere. At the mines of the Cambria Iron Works, Johnstown, Penn., it has been successfully applied to driving coal-cutting machinery. Immense expenditures and great lose of time have heretofore been necessary to secure ventilation in mines by the sinking of shafts, and driving air entries, etc. By the introduction of compressed air these outlays can be almost entirely avoided, now that we have a power at hand available as steam for doing our mining work at points where steam cannot be used. We must seek out and set to work the best machinery for drilling the rock and cutting the coal. More than three years of steady work at the Mount Cenis Tunnel, and almost as long in English mines, demonstrates the fact that there are machines to be had which will do good work, and have them we must; if our own countrymen cannot furnish them we must import them or be behind the age. Is it not remarkable that in the department of mining and drilling rocks, few, if any, improvements should have been made, while in almost all other branches of industry the advance has been marked and regular. The time has now arrived for rapid development of the unbounded mineral wealth stored up in the bowels of our western world. That development should, and we trust will, be not only rapid but comprehensive and systematic. To accomplish this desideratum, mine superintendents must disenthrall themselves from the influence brought to bear upon them by the contracted ideas and clannish habits of Cornish miner laborers—perhaps of all men the most obstinate and troublesome to deal with.—*Am. Artisan.*

ARTIFICIAL STONE.—It is said that within the last two or three years, by a process of slow cooling, a durable artificial stone has been produced at several iron works in France and Belgium; and that this stone has been used for building purposes, and as paving stones for roadways.

THE GEOLOGICAL SURVEY OF INDIA has now been in operation for about ten years, under Mr. T. Oldham, LL. D., as director. It has thoroughly investigated and mapped out an area more than twice that of Great Britain, or 186,000 square miles.

IT is said that a machine for making ice has been invented in London, which will produce eleven pounds of ice in an hour, at a cost of not more than half a cent per pound.

AN IMPORTANT DISCOVERY in flax culture is announced in Australia, by which the same material is cleaned with but little labor, and at a slight cost.

OIL REFINERIES.—It is said that there is about 200 oil refineries in the United States.

SAGE BRUSH FOR FUEL.—We have frequently alluded to the growing importance of the sage brush of our Eastern and Southern plains as fuel for making steam. A late correspondent of the *Alta* of this city refers to this matter as follows:

Mr. Holt, of the Winnemucca Silver Mill, on the Humboldt river, Nevada, announces that he has used under his boilers, during the last four months, no other fuel than the large variety of the sage plant, which covers so vast an area in that country.

He assures us that it answers every purpose, and he has no objections except that it requires somewhat oftener feeding than the light cedar which is the firewood of that country.

With one horse or ox and an iron book the plant is readily pulled up by the root, which is equally good fuel as the stem and branches. It is used at once without seasoning. Sage brush is full of oil, burns with great flame, and holds fire long enough in its embers. The cost is one-fourth that of cedar wood at ten dollars a cord. The smaller sage plant can no doubt be utilized by compressing in a hay-press. Greasewood proves, on trial, a fuel scarcely inferior.

Thus it is that in the order of Providence well studied, man finds every provision is made for the development of whatever product may be found in any part of the world. And we have every reason to believe that some equally cheap and convenient material exists in our gold regions for the desulphurizing of ores now unavailable.

$5,000 Legal Tender Notes at 72¾ pr ct. s 30.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, June 16, 1866.

We have to report a continuance of the same ease in the money market noted for months past. The applications for discounts in Bank are, perhaps, rather more numerous, but the supply of money is abundent, and the rates remain as formerly—1@1¼ ₱ cent. per month for prime short puper end other good collateral. Mining share collaterals are still out of favor with capitalists. A few of the best—such as pay dividends—are, however, still made the basis of discounts but the weakness of the stock market, and the almost total demorulization of some shares that a short time since held a high position have greatly augmented the distrust of money lenders.

The latest telegraphic dispatches from London represent a less favorable condition of affairs than was reported a few days since, and although the Bank of England had reduced its rate of discount to 10 ₱ cent. per annum, additional failures in banking and commercial circles had occurred, and a feeling of decided uneasiness and insecurity continued to prevail both in London and upon the Continent. Preparations for war in Europe seem to be making much progress, both in the shape of armaments and also with regard to the means for meeting the expenses of the conflict. The best informed and most intelligent foreigners of this city, who, a short time since, were willing to believe that a war would not be the result of present negotiations, are now less sanguine, and feel that matters have assumed so threatening an aspect as to preclude the possibility of a peaceful solution of the difficulty

These difficulties abroad are not likely to materially affect us on this side, and, so far as we can learn, little or no capital invested here on foreign account is likely to be disturbed. A portion of the means of some firms will doubtless be sent home, but the amount required for this purpose must be inconsiderable, and the loss of it will not be felt.

Receipts of treasure from domestic sources since the 8th instant, have exceeded $950,000, making an aggregate of some $2,150,000, thus far, during the current month.

The bullion market has been very active this week, and bankers and others have taken at full rates all that was offered. The shipment East, per this steamer, promises to be unusually large. Gold Bars are ranging at 880@890, and Silver may be quoted at 1¾@2 ₱ cent. premium.

Legal Tender Notes closed last Saturday at about 73c., rose on Tuesday to 74¾c., seller 30, then were sold at 73@73½c, and since at about 73c. Gold was quoted in New York at 138 on the 11th, at 143 on the 12th, at 146 on the 13th, and at 148 on the 14th. Large shipments of specie abroad continue to be made, with gold scarce, and commanding ⅛th per cent. interest per day.

The Mining Share market was decidedly apathetic early in the week, but during the past few days rather more life has been exhibited, and a number of stocks are now in better request at enhanced rates. There is, however, an almost total absence of speculative inquiry among dealers, and transactions at the Board have been lighter than for six months past.

Crown Point has met with no sale this week, but is well held at about $1,150. During the week ending June 10th, 671 tons of ore were hoisted to the surface. It is said that considerable first-class ore has been disclosed recently, and that the south drift on the 300-foot level is looking particularly well. The average yield of 2,467 tons of ore last month, was $44 per ton, and 92 tons of first-class ore averaged $428 per ton.

Savage is in better favor, advancing from $860, seller 30, to $995, buyer 10, then selling at $1,010, and closing at $1,025 bid. During the week ending June 9th, 591 tons of second and third-class ores were hoisted from the mine, the upper stations yielding 105 tons, and the balance coming from the sixth station. Some little ore has been found in the north drift from the sixth, and the winze sunk 20 feet from the latter is said to show good ore throughout the whole distance. The body of ore in that level continues to extend toward the northwest and southeast, and two months' work has not yet exhausted two floors of the ten to the fifth station. The old shaft has been sunk 70 feet below the sixth level.

Hale & Norcroes has been sought for at higher figures, and some 80 feet were dealt in within a range of $962@$1,000, selling yesterday at $950@$960, ex-dividend of $50 per foot. A decided improvement has taken place recently in the *quality* of the ore met with in raising up from the 700-foot level. The drift from foot of incline (780-foot level), is vigorously under way.

Gould & Curry rose to $745@$750, and closed at about $760 bid. There is nothing new in the lower explorations, but the upper portion of the mine continues to hold out remarkably well. In January last the Superintendent of the company estimated that some 30,000 tons of ore could be taken from the upper levels. Since then more than that amount has been extracted, and from present indications it would appear that 25,000 to 30,000 tons yet remain.

Yellow Jacket rose from $635 to $660, receded to $637½, rallied to $675, and was dealt in yesterday at $690@$695. Private letters speak favorably of recent developments, and it is probable, that the present balance at the credit of the company will be materially increased at the close of the current month.

Ophir steadily advanced from $295 to $352½, and sold yesterday at $355@$340. The eighth floor of the ninth gallery still shows ore going south, but it is of low grade. The eighth gallery hee been cleaned out, and the development of the top of the ninth will thereby be much facilitated. Some 20 tons of ore per day are now taken from the fifth station, and receipts of bullion to the 12th inst. amounted to $21,000.

Chollar Potosi has been actively dealt in, and nearly 600 feet were sold within a range of $187½@$212, closing at about $203. The Piute station is producing about the same quantity of ore as formerly, and the New Santa Fe station continues also to look well. The Superintendent reports, "in other parts of the mine no material change," also remarking, "it is pleasing to mention that the mine generally presents a more flattering appearance than for some time past." The first station drift from the new shaft is in some 475 feet, but recent indications are thought to be less encouraging than they were last week. During the week ending 9th inst. 648 tons of ore were sent to custom mills.

Alpha rose from $300 to $350, declined to $320, and then sold at $250.

Belcher steadily advanced from $160 to $194, and was dealt in yesterday at $190@$195.

Empire Mill and Mining Company was sold at $140@142½, seller 10, closing at $150 asked.

Imperial receded from $112 to $107, rose to $122, and sold at the close at $117@$110. It is thought that some 10,000 tons of ore (worth $25 to $30 per ton), may yet be found above the sixth level of the Holmes mine.

The aggregate sales of Stocks and Legal Tender Notes since Saturday last, amounted to $262,822.

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,
Principal of the City College.
6v12tf Or at 406 California Street.

SACRAMENTO SEMINARY.

BOARDING SCHOOL

FOR YOUNG LADIES,

Tenth Street, between F and G.

SACRAMENTO, CAL.

Session commenced January 8, 1866.

MR. AND MRS. HERMON PERRY,
7v12tf Principals.

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignatius College, Market street, San Francisco.

3v11 REV. A. MASNATA, S. J., President.

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLAture of the State of California, entitled "An Act concerning Corporations," passed April 22, 1854, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD..... $750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS

IV.—The amount of Insurance effected during the year, and which remained in force December 31, 1865:

Fire..... $12,973,949
Marine..... 484,408

This Company commenced underwriting Marine Risks, August 1, 1865:

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

International Hotel,

JACKSON STREET,

BETWEEN MONTGOMERY AND KEARNY STS.,

SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

Prices, varying from $1 50 to $2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for 50 cents

21v12 F. E. WEYOANT, Proprietor.

INTERNATIONAL HOTEL,

K Street, between Third and Fourth,

SACRAMENTO,

IS NOW ONE OF THE LARGEST AND MOST ELEGANT Houses in Sacramento. It has seventy-five Rooms, which can be had in suites for families, or singly to suit individuals—all new-furnished, large and finely ventilated. No expense has been saved to make it comfortable and pleasant for guests.

Price of Rooms very low. Meals, 25 cents.
8v12-6m R EISENMENGER.

BRANNAN HOUSE,

(Formerly Vernon,)

J street, between Front and Second streets,

SACRAMENTO.

FIRST-CLASS ACCOMMODATIONS CAN BE HAD.
8v12-3m MRS. J. DUNN, Proprietress.

WHAT CHEER HOUSE,

SACRAMENTO.

Fire-Proof Brick Building, cornor Front and K Streets, opposite Steamboat Landing.

Meals	25 cents.
Board, per week	$4 00
Board and Lodging, per day	1 00
Single Rooms	50

Railroad Ticket Office and Stage Office on first floor.

CALIFORNIA BUILDING AND LOAN SOCIETY

Removal Notice.

THE DIRECTORS OF THE CALIFORNIA BUILDING and Loan Society, announce to the public the removal of their business to their

NEW BANKING HOUSE,

California street, one Door from Sansome.

LOANS.

The Directors propose an extension of their Banking accommodation to the assistance of—

First—The Purchase of Real Estate.
Second—The Erection of Houses.
Third—The Erection of Manufactories.
Fourth—The Building of Sea and River Vessels of all sizes.
Fifth—Mercantile Cash Credits on the Scottish principle, for such time as may be agreed upon.

Under the above general heads, loans will be made for terms of years to correspond with the requirements of parties upon the security of REAL ESTATE, BUILDINGS, SHIPS and MERCHANDISE.

MONTHLY DEPOSITS.

ONE PER CENT. PER MONTH will be allowed on all deposits made at one month's notice of withdrawal.

CURRENT ACCOUNTS.

HALF PER CENT PER MONTH will be allowed on the daily balances to credit of Current Banking Accounts—the same to be ascertained and credited monthly.

REMITTANCES FROM THE COUNTRY PROMPTLY ACKNOWLEDGED.

INTEREST on all sums commences from the day of deposit.

DEPOSITS of any amount received, from FIVE DOLLARS upwards.

OFFICE HOURS—9 1-2 A.M. to 3 1-2 P M. daily.
SATURDAY EVENINGS from 6 1-2 to 9 o'clock.

THOMAS MOONEY, President.
W. G WEIR,

VOLUME TWELFTH.—The Mining and Scientific Press with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

A Rare Chance!

A Splendid Business in Alameda County.

FOR SALE AT A GREAT BARGAIN,

400 ACRES OF LAND,

INCLUDING

Landing, Wharf, Three Capacious Warehouses,

Capable of holding 12,000 Tons, which amount of grain was stored and shipped the past year. Connected with said business there is an extensive Lumber Yard; sales during last year, two million feet, which sales, and the entire business, can be largely increased.

The above is a rare opportunity for parties desireus of engaging in an active business that will pay a large dividend on the investment. Satisfactory reasons given for selling, and all information desired can be obtained on application by mail, or otherwise, to

G. F. SMITH,
Notary Public and Searcher of Records, Office "Beatty House," San Leandro. 23v12-m

SPLENDID HOMESTEADS! IN THE COUNTRY.

Twenty-Two Acre Blocks

Adjoining the beautiful Town of

San Leandro, Harlan's Addition

BUT ONE HOUR'S RIDE FROM SAN FRANCISCO.

Property but a few rods from the Railroad Depot. Good schools, good water, splendid view, free from wind and dust, and the best of soil.

☞ Title—U. S. Patent. ☜

A rare chance to buy a beautiful Homesteed for your wife and little ones, at a low figure.

—ALSO—

Improved Homesteads and Farms of 20, 50 or 100 Acres,

In Alameda county. The most desirable locations in the State. Apply to or address

VALUABLE MINES!

FOR SALE

IN NEVADA COUNTY.

FOUR VALUABLE QUARTZ MINES, SITUATED AT THE base of Deer Mountain, and about equi distent from Grass Valley and Nevada City, are now offered for sale These ledges run parallel with each other, are wide and well defined, varying from fifteen inches to four feet in width, and have been sufficiently developed to prove them to be of great prospective value. One of them is an extension of the famous Star Spangled Banner. A shaft has been sunk on the extension to a depth of thirty feet, where the ledge is fully two feet wide, and prospects quite as well as the Banner did at that depth. On account of water, further progress downward was impossible without machinery. These claims are accessible at all seasons of the year, and wood and water exist in their immediate vicinity in great abundance. Parties who would prefer putting up machinery and sinking on one or more of these claims, for an interest in them, can do so, and liberal terms will be granted by the present owners.

Persons desiring to purchase claims, or erect machinery to prospect the same, will find this a capital chance. For further information, reference may be had on application to the Editors and Publishers of the Mining and Scientific Press, 505 Clay street, San Francisco. 21v12

WM. H. KEITH & CO.,

Chemists and Apothecaries,

PROPRIETORS AND MANUFACTURERS OF

WM. H. KEITH & CO'S WINE OF PEPSINE, OR RENnet Wine, a new and efficacious remedy for Dyspepsia, Castralgia, etc. WM. H. KEITH & CO'S GLUCOLEIN, a new and valuable compound of Cod Liver Oil, put up in glass jars. WM. H KEITH & CO'S LEMON APERIENT, or Purgative Lemonade, an agreeable, cooling and active purga tive, or mild laxative, as required. WM. H. KEITH & CO'S SAPONACEOUS TOOTH POWDER. DEVINE'S PITCH LOZENGES, for the cure of coughs and colds. Wm H. Keith & Co's Florentine Tooth Wash. Wm. H. Keith & Co's Granula Effervescent Citrate of Magnesia. Wm. H. Keith & Co's Rosemary and Castor Oil Hair Invigorator.

WM. H. KEITH & Co. being in frequent communication with Eastern and European markets, are continually renewing their stock of Pure Drugs, Rare Chemicals, Fancy Goods, and Toilet Articles, Pure Oils, etc. They also give special attention to replenishing ship medicine chests.

Also, just received a large and well-selected invoice of HERNSTEIN'S CELEBRATED INSTRUMENTS, consisting in part of Amputating and Obstetric sets, Pocket Cases, etc.

Physicians and others at a distance ordering goods from us, can depend upon having their orders filled with the same regard to QUALITY and PRICE, as though obtained in person, and we give particular attention to packing and forwarding the same.

15v12ly Between Clay and Commercial, San Francisco.

Eyes! Eyes!! Eyes!!!

DR HENLY, OCULIST AND AURIST, HAS received from Scotland one of the most miraculous REMEDIES for the benefit of the HUMAN EYE ever before discovered. It is unparalleled in its effects upon the diseases incident to this organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all mucous film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the Eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.

Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and I do not give them relief in a short time, I WILL NOT CHARGE THEM ANYTHING. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco. 22-v12

Mining Summary.

CALIFORNIA.

Alpine County—

The Silver Mountain *Bulletin* of June 2d, publishes a letter from B. Pilkington, Esq. to the President of the Buckeye No. 1, which we condense: "Wilmington, Del., April 24th, 1866. I have contracted with the Northwestern California Gold and Silver Mining Company, of Milwaukee, State of Wisconsin, to rent your mine for six years, on the terms and conditions of the power of attorney made by your company to me for such purpose. The terms of lease are 30 per cent. of the nett profits. * * * * They will at once, as soon as they can get subscribed their whole amount of stock, and collect 35 per cent. thereon, send on their superintendant to take charge."

Same paper has also these items: Advices from the East by Wednesday evening's mail, informs us that O. F. Thornton, Esq., who went East for the purpose of interesting capitalists in the Buckeye No. 2, will succeed.... The Wisconsin G. & S. M. company, in this district, has passed by Sheriff's deed into the hands of O. Tanner....O. Tanner and S. Gullickson have a contract for running a tunnel in the claim of the Imperial company 60 feet, at which point it is supposed they will cut the ledge.

The *Chronicle* of same date, says: To-day teams commenced hauling ore from the Mullan claim at Mogul, to the Pioneer Quartz Mill in this city. The mill will commence running next week.

The *Miner* of 9th inst. has these items: Work is going ahead on the Mountain, Pennsylvania, Balaklava, Washington, Silver Mountain, Kohinoor, Maine and Pittsburg claims. ....The result of the working of ore from the Balaklava is not made public....A 22-stamp quartz mill now running in the vicinity of Virginia, is to be removed to the Pennsylvania mine....A couple of gentlemen, superintendents of prominent claims in this vicinity, intend visiting the Swansea Smelting Works in Washoe Valley, next week, with a view to the introduction of similar works here....The drift from the bottom of the American company's shaft, to cut across the new lode, is now 33 feet from the west wall, and no signs of being through yet. The lode is evidently a very large one, and for nearly 20 feet the ore has been improving in amount, though all of a similar character....An assay of Winchester ore, made on the 4th inst. by Leopold Kuh, of Nevada, gives $85.64 of silver, and $8.83 of gold; total $94.47 to the ton of 2,000 pounds. During the present week a side cut has been run, opening the vein perhaps 12 feet from the tunnel southward; the present width is over six feet, and increasing both in width and the good appearance of the ore as they go in....The house over the new shaft of the Mullan company is now completed, and another shift, making four men, will prosecute the work, commencing Monday. The vein of ore is widening as opened and improving in quality.

Amador County—

The *Ledger* of June 9th, says: One hundred and thirty tons of rock, taken from the Vaughn mine, at Pine Grove, was crushed last week, and yielded a little over four thousand dollars. ....The Oneida mill, with its forty stamps, can be plainly heard every still evening thundering away.

Butte County—

The Forbestown correspondent of the Marysville *Express*, under date of June 2d, says: "Messrs. Parks & Platt, owners of several valuable quartz lodes here, are now thoroughly renovating and improving their steam mill, and will commence crushing ore from the Spanish leads Nos. 1 and 2, in the early part of next week....The lodes of Roberts & Co., and Plum, Maddox & Co., about two miles from here, are now being worked and show very flattering prospects. Shafts over one hundred feet deep are being sunk on these ledges."

Calaveras County—

The Copperopolis *Courier* of June 2d, says: The new mill of the Rawhide Ranch company is said to be working beautifully....The late rains have compelled the Kentucky company to suspend work in their new shaft. A few days previous to the rain the lead looked somewhat better than at any time before....But three claims are now being worked in this district. Are capitalists insane? If not, why do they not come and invest?

The *Register* says: Parties owning the quartz claims at Angels are busily engaged in prospecting them. Several of the claims which have in past years been worked with indifferent success, have changed hands, and the new companies are commencing in earnest to develop them. Mr. Bovie who has purchased the Winters' claim, has a shaft down about one hundred feet.

Colusa County—

The *Sun* says: Mr. Whiting has spent $20,000. In going down 607 feet he has gone through six different streams of oil. He intends now to pipe the well down and then cut the pipe at each of these. His best indication is below 600 feet and he is confident that he now has oil in large quantity, although it will yet take time, patience and money to develop it.

Fresno County—

The Millerton correspondent of the Mariposa *Free Press* says: "Some of the finest specimens of native copper I ever saw, have been taken out at the Washington vein, near Taylor's ranch. The copper lies in thin sheets in the seams of a white quartz, and when first taken out is as bright as gold. The vein is about five feet thick."

A writer in the *Gazette*, of June 9th, says: Fresno county will at no distant day throw all the Montanas and Idahoes in the shade. The only drawback to successful working of the mines is money, and nearly all of the companies feel the want of it very much. The mines are beautifully situated, and accessible for any and every kind of machinery. Other mines have been opened which are as rich, if not richer, than the one above spoken of. There is scarcely a doubt but that this is the richest copper district on the Pacific coast.

Nevada County—

The *Gazette* has these items: The Burrington company will be ready to start up their new steam hoisting works to-day or to-morrow....The owners of the Deadwood ledge have their machinery completed, and were intending to start the pump yesterday....The hoisting machinery for the California claim arrived on Tuesday. It will be put up and started in operation without delay....The engine for the hoisting works of the Pennsylvania company was received yesterday, and they expect the boiler up in a few days. The company have their incline down one hundred and ten feet....The new mill of the Empire Mining Company, on Ophir Hill, Grass Valley, was started up on Wednesday. From a number of our citizens who went down to see it start, we learn that the machinery worked finely. It cost about one hundred thousand dollars, and is doubtless the best quartz mill in the State. Connected with the mill are twenty-two pans and six settlers, together with all the modern improvements for saving gold and working the sulphurets.

The *National* says, of the new Empire mill, (in addition to the above): The 30 stamps crush 50 tons in 24 hours, receiving the rock from one of Blake's rock-breakers. The Beath grinder next grinds to fineness the entire mass, and amalgamates in connection. The Beaux & Guiod pans—sixteen in number—are used as amalgamators. Six of Howland's concentrating separators follow; then six Knox pans, Hunter's concentrators—twelve in number—complete the list of reducing, grinding, amalgamating, separating and concentrating machinery. The entire machinery of the mill is driven by a splendid engine of one hundred horse power, one of the finest pieces of work on the Pacific coast.

Same paper has these items: On passing yesterday the North Star company's works, on French Lead, we observed a general tearing away of things, preparatory, as we learn, for a series of extensive and expensive improvements....The town of Eureka, on the Henness turnpike, about twenty five miles from Grass Valley, is now a thriving place. Upwards of sixty quartz ledges have been located, and work on them has begun in downright earnest.

The *Transcript* says: The hydraulic claims at Columbia Hill are paying exceedingly well this season. The pay ground is a strata of gravel extending fifty and sixty feet below the surface. After a run of five days, Willis & Phelps recently cleaned up $2,500. Cregan & Bowel in the same time took out $1,200. Wilcox & Co., Woods & Co., and others, are working with excellent success in their claims. ....One hundred thousand dollars was offered for one-sixth of the Allison Ranch mine, last week, and rejected....A party of Chinese went out prospecting the other day, and struck a very fine quartz ledge on Deer Creek, which is about two feet in thickness. It is thought that if it pays well, when thoroughly opened, some old title will be wrong in on them.

We learn that Messrs. Buckman & Curren, of Little York, struck cement in their claims on Saturday week, which is immensely rich. Previous to the last strike the cement had yielded them, upon an average, $1,500 per week, and the top dirt, which is from sixty to eighty feet deep, has averaged $1,000 in addition. They have an 8-stamp mill.

The Marysville *Express* says: Work has been commenced on the cement claims of Messrs. Knowlton & Co., located at Brandy Flat, near Washington. Six men are now engaged in stripping off the surface ground, to enable them to work the cement to better advantage. After this work is done, the mill will be started.

Excelsior.—The Nevada *Gazette* says: The Excelsior company, at Meadow Lake, have contracted for a 20-stamp mill, which is to be finished and in running order by the first of August next. The mill is to be run by a 65-horse power engine, the stamps to weigh nine hundred and fifty pounds each, with the most approved pans, concentrators, etc., together with desulphurizing works....The Gould and Curry Gold and Silver Mining Company, whose principal place of business is at Meadow Lake, has a capital stock of $90,000, divided into 900 shares, at $100 each, and the incorporation is to exist for fifty years. The Manhattan Gold and Silver Mining Company, also at Meadow Lake, has a capital stock of $270,000, divided into 2,700 shares of $100 each....We are informed by parties recently down from Meadow Lake, that prospecting is being prosecuted vigorously in that locality, and that new ledges are located daily. Old quartz miners, who are not apt to be excited, are favorably impressed with the prospects of the district, and many purpose spending their time this season in prospecting near the summit. Not much can be done, however, before the first of July, as there is still an unusual quantity of snow in the mountains.

The Meadow Lake *Sun* says: The greatest demand of our people at this time, is lumber for building purposes. The three mills situated in the immediate vicinity, with a capacity of turning out about 12,000 feet per day, are constantly employed. We noticed yesterday several parties packing animals with the necessary implements for a prospecting tramp through the surrounding country. Extensive fields on the Excelsior range, both north and south of us, remain unprospected.

The Grass Valley *National* has the following: From private letters received in this place from Excelsior district, we are informed of a very rich strike that has lately been made in the Knickerbocker ledge, belonging to the California company. It is estimated that the rock that is now being taken out will yield upward of $500 per ton. Considerable excitement exists at present on account of this development.

Placer County—

The *Herald* of June 9th, says: The Wells lead, three miles north of Auburn, has proved to be very rich. The company recently hauled some rock to Grass Valley and had it crushed. It paid over $20 to the ton. Some of the sulphurets saved from the crushing assayed $560 to the ton. Parties in San Francisco are now negotiating for the lead....The shaft on the Taylor mine is now down sixty feet, and the vein at that depth is three feet thick. The rock is very close grained, and full of sulphurets. Mr. Taylor intends sinking to the depth of 100 feet before he has any rock crushed....The Pugh quartz mill, located at Ophir, is now receiving a complete overhauling and repairing before commencing operations for the summer....A new quartz ledge was struck in the rear of the *Herald* office. It is said to show free gold.

Plumas County—

The Quincy *Union* of 2d inst., has these items: The Monitor company, at Union Flat, is taking out rich pay dirt....The Buckeye company has easy working rock, and expects to strike gravel this summer....The Crescent company cleaned up last week between five and six thousand dollars.

We clip the following from the *Union* of 9th: Dodge & Co. on Hopkin's creek have commenced operations again....Gardner & Blanks, on the Flat, have recently run a tunnel and struck a good prospect....Nohrman & Thomas have been piping for the last four months, and are expecting a big clean up.... Cox & Co. are also at work with their hydraulic. They have not commenced to clean up any bed rock, as yet. All of the other claims on the creek are paying moderate wages.

Poorman's Creek.—Gentry & Co., and Brown & Riddle have been at work piping in their claims during the last four months. They have a good supply of water, and will not commence "bottoming up" for some time.... Turner & Co.'s claims are prospecting well. ....Bradley and Morn & Co., are at work in their tunnels....Foss & Siebert have been ground sluicing during the spring, and have a large piece of ground "stripped" ready to clean up....O'Neal, Coyle & Co., at Hopkinsville, have been sluicing all the spring, and have just set their sluices for a clean up.

Nelson Point and Vicinity.—The miners in this locality are all preparing for a summer's work....Murken & Co., and White & Richards have got most of their timbers upon the ground, and will commence operations in a few days. ....Several Chinese companies are getting ready to put in flumes and wing-dams in the river....White & Fell are at work upon Hottentot Bar. This bar has been abandoned for the last eight or nine years, but it is now paying from ten to twelve dollars per day to the hand....Jackson, Jolly & Co., at the Willow Ranch, are doing well in their lower claim. It is paying from twelve to fifteen dollars per day. They will commence cleaning up in their upper claims in a short time.

Shasta County—

From the *Courier* of June 9th, we clip the following: On Wednesday last Larkin & Fuller finished their contract for sinking a fifty foot shaft on the lode close to the Uninn mill.... In the South Fork district there is considerable demand for quartz miners to do underground work....Returns from a run of sixteen and a half days, by the Washington mill, give a result, after melting and assay, of $2,243.40. ....The lower tunnel in the William and Kellinger is now in 946 feet, and is 450 feet below the surface of the mountain. The workmen have just passed through a vein, about six inches wide, that gives out mineral which seems to be rich in copper....The Potosi have secured the services of a practical millman, experienced in sulphurets of the kind which they have to contend with. They are offered $208 per ton for their rock delivered in Sacramento....On Tuesday last we visited the Bunker Hill claim. The gold obtained is fine as flour, and is found imbedded in soft slate, in thin strata of decomposed quartz. There are places in the mine where from $500 to $10,000 have been taken out in from one to twenty-four hours. * * We are fully convinced, from a cursory examination, that the company would reap a rich return by milling all the slate rock in the lode....Last week Messrs. Hall & Co. located a gold bearing quartz lode near Hogtown, on Indian Flat. From twelve pounds of the rock, crushed in a hand mortar, two dollars was obtained; and besides this, the company have specimens weighing from one-half to two or three pounds, that would pay two or three dollars to the pound. They will commence taking out rock immediately, with a view to having it crushed in the Spring Creek mill....Daniel's claim is equal in novelty and perhaps in richness. He finds his gold as they do in the Bunker Hill claim—in seams and pockets where small strata of quartz have decomposed and left it. He and his partner have taken out already sufficient, if judiciously invested, to make them comfortable for life, and yet have made but a very small opening in the mine....We are informed that an English company at San Francisco are negotiating for one of the organized locations in South Fork district. It seems that some second class rock from a claim had been sent to the Bay; that the company in question got hold of it, tested it, and proved its value to be $385 to the ton, and announced that if one thousand pounds of such rock could be sent them, they would take the claim at $100,000, and that the proposition has been accepted and the rock sent forward. This may or may not be true so far as the bargain is concerned, but we know the rock has gone down to the amount of a half ton, or over, and of a quality that will prove better than any previously sent.

Every day new locations are being made in the district, and old locations being proven to a slight extent, with most astonishing results.

Sierra County—

The *Advocate* of June 9th, says: We are glad to hear that the claims on Silver Bow gulch are rising rapidly in value on account of striking the real pay channel, and the discovery of auriferous deposits in the bars lining the creek. A company of eight men are now engaged on a ditch which will supply water for the sluicing of about 1,200 acres of dry diggings, lying between Brown's gulch and Silver Bow creek. There is a fine prospect obtainable at the very surface of the ground. A friend of ours, owning an eighth in the ditch, was offered $800 in bankable dust for his share, before he passed a single dollar of assessment. There is any amount of work at $6 per day for all who want employment.

Siskiyou County—

The Yreka *Union* of June 9th, says Mr. Lash discovered a lode of rich gold bearing quartz last week on Humbug, which assays $601.07 gold, and $3.40 silver to the ton.... This county abounds in untold richness in gold and silver bearing quartz, which needs only capital and industry to develop it. On Deadwood, Humbug, Cottonwood, and in Scott Valley, are millions of dollars in the precious rock.

Trinity County—

The *Journal* says: It is gratifying to notice that the attention of people in other sections of the State is being attracted to the as yet but little explored New River mines of this county....All the miners employed there now are making money, water is plenty, and the opinion of old practical miners is that there are mines enough on that stream and its tributaries for a thousand additional men. The diggings can be reached in two and a half days from Trinity Center, or two days from Weaverville.

Tuolumne County—

From the *Courier* of June 2d, we clip the following items: This week we were shown some chunks of gold that were taken from a claim on Bald Mountain, on Saturday last. The sight of them was bewildering. They came from a pocket which in a day yielded to the labor of one man, 214 ounces of gold, and

has not yet been worked out. The same person, last March, took out in one pan of dirt upwards of $2,000....We have seen some good samples of rock from the Good Friday claim, located just this side of Soulsbyville, about half a mile from the Draper claim. The rock is very rich in sulphurets, and shows free gold. By mill it pays from $25 to $40.... The Grizzly mine and mill are again in operation, having been closed for some months, owing to litigation. The mill started on Wednesday, upon very fine quartz....The Buchanan claim, situated about 16 miles east from Sonora, near the north fork of the Tuolumne river, is turning out to be a leading mine. The ledge is 12 feet wide, and the rock yielded at the last crushing $65 per ton. The clean-up on Tuesday amounted to $3,500....The Deer Creek mill, on one of the forks of the Stanislaus river, is in full blast, crushing rock which pays well every time....The machinery for a 5-stamp mill, for the Starr King claim, in Sugar Pine, is being constructed at the foundry.... We were told yesterday that some Mexicans, working about a mile below Jamestown, toward Quartz Mountain, struck a pocket on Thursday and took out $40,000....A ledge belonging to Harry Gould and others between here and Jamestown, promises well. A working test of the rock gives a result of $63 to the ton. It is the same character of quartz that yielded so well at Brown's Flat....Hulck & Co., near Poverty Hill, have a good vein of decomposed quartz....Phelps & Co. have completed their contract for the 15-stamp mill to be put upon the Josephine claim, on Bald Mountain. The building is up, and a great part of the machinery is on the ground. It is expected to be running the 1st of July ...The claims about Columbia and Tuttletown are being actively worked, as also are those on Wood's creek, near this city.

Yuba County—

The Brown's Valley correspondent of the Marysville *Appeal*, says: The old Yuba will be hereafter known as the Rattlesnake Mining company, and the directors will resume work immediately. Their rock has always paid from $16 to $20 per ton. The Dannebroge, the pioneer mill, has commenced operations again, and "mashing" good rock; this mill is supposed to be running on a ledge of its own—that is, not on the Pennsylvania ledge, from which the Jefferson and Pennsylvania companies take their rich rock. The Sweet Vengeance mill has stopped. The Pacific company, which joins the Jefferson on the south, lying between the Dan Webster and Jefferson, is trying titles at law. The Jefferson company is still successful. The Pennsylvania, which joins it on the north is crushing about eight tons of rock per day. Their machinery is entirely inadequate for the labor to be performed. The rock recently struck is as good as the best taken from the Jefferson. Owners in the Dan Webster begin to stir.

NEVADA.

Washoe—

The suit between B. Hastings and the Burning Moscow company has been decided for plaintiff.

The Lyon county *Sentinel* of June 9th says: The Rock Point mill started up last Saturday, running its full complement as steadily as before the break. The dam has been very substantially repaired, and we understand that additions will be made during the summer.... They have replaced their breaking battery with one of Blake's patent rock breaking machines.

Reese River—

The *Reveille* has the following items: Work has been commenced on the Morgan & Muncey mine, under the new arrangement, and a contract has been left to sink an incline shaft to connect with the lower and steeper portion of the main incline, which had been cut at an irregular angle....We learn that powerful hoisting machinery has arrived to-day at the Ontario mine, about four miles northeast of Austin....Within the past few days Boalt & Stetefeldt have made a number of assays of mineral from the Philadelphia and Hot Creek districts, which take a high range—the former from $37 to $700, and the latter from $200 to $600....We learn from Mr. Atchison, who has just arrived from the Clan Alpine district, that the 10-stamp mill of the Silver Lode company will be completed and running on the 25th inst. It had already been tested, and reduced forty tons of ore with entire satisfaction.

The Nye County *News*, of June 2d, says: We hear of recent discoveries made in the south and eastern part of this county, which, if reports are to be relied on, beat anything yet discovered, the Comstock not excepted. Two new districts, the Silver Bend and Hot Creek, have recently been laid off in that direction, the ledges of which are pronounced No. 1....Teams are now hauling ore for the Knickerbocker Mill, which is expected to start sometime next week, provided certain machinery arrives in time, which has been sent for....Our miners still continue to work away as busily as ever, endeavoring to have a good supply of ore on hand against the time of starting the Knickerbocker mill. The number at work on the mines has been greatly increased during the week, and we learn that a large quantity of fine ore is being raised. We have heard of no every rich strikes, though all appear satisfied with the prospect of their claims, and we hope better days are in store for all.

The *Enterprise* says: The party of men who left here some three months ago for the Silver Peak and Red Mountain country, have been at work upon the New York ledge, located about four miles west of Silver Peak, and have struck very rich ore. This lode is reported to be about fifty feet in width, and shows thousands of tons of the very best looking quartz in the croppings.

Esmeralda—

The *Union*, of June 2d, says: The mining news from Hot Springs is encouraging. The Diana, Cornucopia, Kearsarge and Commanche companies are all taking out excellent ore. The Diana mill is kept running constantly, and the ore yields very well. Some of the companies are sinking deep shafts to explore their mines, and are saving the ore taken out in the operation for shipment to Europe.

Humboldt—

The *Register* of June 2d says: Mr. Lark, superintendent of the Rochester company, has been at work one month. Finding the ledge dipping to the west, he broke ground at a distance of 200 feet west from the east wall of the ledge, calculating that in making about 200 feet depth in a vertical shaft he will cut the ledge. He has a fine shaft four and a half by seven feet, and in one month has made almost one hundred feet in depth. He is pressing work as fast as six men can do it....Thousands of tons of ores lie in sight in the Montezuma, Jersey, Daisy, and neighboring ledges. We are glad to learn that parties understanding what is wanted in these Aralin mines are negotiating with capitalists in England for means to open and work several of these valuable ledges.

Placer Diggings.—In Woodman Cañon, fifty five miles up the river, good prospects of wash gold have been found. An Indian led parties to the place, and by pan process they washed out prospects as high as four bits.

Pahranagat—

The *Reveille* says: Lieut. Seamands writes very hopefully of the prospects of that section, and parties there promise to mould the first silver brick from Pahranagat ore on the fourth day of July next. He says two smelting furnaces will be completed by the 15th of June; they are being erected by New York companies, who have a number of men employed under the superintendence of an experienced German metallurgist. * * The recent act of Congress extending the eastern and northern boundaries of Nevada, seems to have been the occasion of unusual felicity to the Pahranagaters. It not only increased the area of the new (Lincoln) county, but its population at the same time, by taking in the Mormon settlements of Meadow Valley and Muddy, in Utah, and Callville and El Dorado Cañon, in Arizona, which will give it a population of about one thousand.

ARIZONA.

The *Miner* of May 23d has the following items:—Van Smith and Christie have bought the Swilling mill at Wickenburg, and will immediately put it on the Sterling lode....Most of the timber has been sent from town for the Big Bug mill, and we learn that part of the machinery is now on the road from La Paz. ....Jack Swilling and his followers, to the number of eighty or one hundred, have congregated at Wickenburg and Pima villages, and will leave upon the proposed expedition to the White Mountains on the first of June..... Correspondent of the same paper at Lynx Creek says: One mill is now running, and two more being built. Of the latter, one is by Mr. Lamson, with the newly-invented Thunderbolt Crusher, with capacity equal to twenty stamps, old style. * * The Eureka, opened at three different points, develops very rich gold quartz from good sized veins. In the Accidental the pay vein is tolerable small, but very rich, and pays well. The Boston, Deadwood, Plymouth, and several others on Eureka Hill, near the creek, are known to possess ledges of much the same character as those already opened. From the placers on this creek a large amount has already been realized, and extensive ditching is now done with the object of pursuing this work more vigorously and on a much larger scale. * * At Big Bug, Messrs. Borger & Co. have the foundation and frame-work for a 10-stamp mill nearly ready. The machinery is on the road from La Paz, and it is believed the mill will be in operation inside of sixty days....Woolsey's water-power mill will soon be running.

Correspondent of same at Williams' Fork writes thus of the copper mines there, under date of April 29th: Martin & Co., (Lightner,) of San Francisco, are working about two hundred men, mostly Mexicans, and taking out about two hundred sacks of copper ore per day. They have shipped some four thousand tons this spring, and will ship by the next boat one hundred tons more. They are taking out and sacking one hundred and twenty sacks per day at the Mineral Hill mine. The company are working some nine mines, including the Challenge mine, near Empire Flat. The ores taken from the mines average about thirty per cent. The Planet, situated on Williams' Fork, about fifteen miles from the Colorado river, and about three miles from Mineral Hill, is also being worked extensively, principally by Americans. This company is shipping considerable ore. * * Mr. Thompson is now placing reduction works upon the Eliza, near the Planet. Labor is from fifty to seventy-five dollars per month.

COLORADO.

The *Journal* of May 22d, has the following items: Work has been commenced on the Texas lode....The Mammoth mill is stopped for repairs to the flue. The Liebig company, at Empire, is going to build a Keith furnace next week....The Cook company's lease of the Excelsior mill having expired, the Alliance has taken the mill in charge....The Crosby & Thompson men feel more encouraged than ever, four or five test assays seeming to prove that they get 80 per cent. of the gold....Prospecting is lively over in Fall River. A new lode was recently struck near the Almy which assays $300 to the ton....The Montrose mill is again running, after detention for repairs and from bad weather....Charley Tyer is sinking on the Golconda Discovery, and showed us beautiful specimens of quartz full of native gold....Mr. Baker, an old resident of Russell gulch, has just returned from the East, where he succeeded in organizing a company on some of the best lodes near the head of the gulch—Iron, Nashville, Fairview, and others. Benson Bros. have come on to commence work. There is little doing in Russell as yet....Mr. Bruce started his mill yesterday, running by water, and on ore from the Simmons. Mr. Armor is working on the Simmons, and has struck a fine vein of ore fifty or sixty feet from the surface....A new mill has recently commenced running at Downieville Bar, on ore from the Hiawatha lode....Last week the B. H. company cleaned up 226 ounces, Sensenderfer, 162, Narragansett, 125. Small lots, 30. Cook company, (Crosby & Thompson) 25 oz.

From the Denver *News* of May 25th, we gather the following: Freight to Deaver, from the Missouri river, 650 miles, is only six and seven cents per pound....Work in the mines in the vicinity of Georgetown is being commenced in earnest. Several parties are about to erect furnaces for the reduction of the ores, large quantities of which are already exposed. The Pioneer Silver company have contracted for the opening of 15 or 20 veins, and the work has already been commenced.

The *Register* says the Hope desulphorizer sends 103 oz. 6 pwts. and 12 grs. (103 6-12), value, advanced $2,000. The Ophir company has from stamps 91½ oz., value, $1,600. The Philadelphia from among its first runs on Gardner ore, returns 34½ oz., value $700. The First National company sends 58 oz....Hereafter all the bullion from works will be sent to the mint in Denver and run into bars. Only one of the reverberatory furnaces is running at present. The failure of the McKenzie blowers to arrive, practically reduces the working capacity of the establishment eighty per cent.

IDAHO.

The *Alta's* correspondent at Boise City writes, under date of May 19th: "Boise county reports are very favorable. It is the opinion of those most competent to judge, that the mines in that county are paying far better than ever they did. The news from Alturas county, although all mills are yet at a stand, is good. The Waddingham mill will start up in a few days, and also the Idaho mill—the former on Confederate Star rock, and the latter on Idaho. Mons. De la Baume had been experimenting at Rocky Bar, with his new process for disintegrating rock, and reported that the cost at that place, was four dollars per ton; that his experiments have been perfectly successful, and that all the expensive machinery, and costly apparatus and magnificent mills, are dispensed with. * * * The Yoba district is twenty miles from Rocky Bar, and as soon as the road is finished to that place, several mills will go in. I will give the names and width of some of the lodes, on which most work has been done; the Atlanta varies from six to thirty feet; Pacific, ten feet; Minerva, ten feet; Olive Branch, fourteen feet; Golden Wreath, six feet; Great Mogul, eight feet; Mountain Pride, five feet; Red Jacket, ten feet; Dubuque, twelve feet; and all of these, so far as tested, have proved rich in gold, and all, except the Great Mogul and Minerva, in silver, also. The Altemonte is another, from which twenty-five to fifty per cent. is the prospect for an ordinary piece of rock.

The Havermire company, under the charge of Dudley Hoyt, have run a tunnel three hundred feet long into the Henrietta ledge, striking the lode about 250 feet from the surface, where they find it well defined, and the rock prospects well; the lode is five feet eight inches wide between the casings.

Placer mining is being carried on in Alturas county, and placer claims, although limited in extent, are, in some places, very rich. Charles Rogers & Co. have not, in the last two summers, taken out of their claims on Feather river (working twenty-four men about five months in the year) less than ten thousand ounces of gold.

Wages at Rocky Bar are now seven dollars a day for good workmen."

A party of fifty Chinamen, from Virginia City, were attacked near the Owyhee river by about 150 Indians, and 49 killed....Twenty teams have loaded the past week, says the Chico *Courant*, and start at once for Idaho. Some go to Boise City, some to Ruby City, and some to South Boise, taking 120,000 pounds of freight.

BRITISH COLUMBIA.

The *Oregonian* says that at last accounts from the Big Bend mines, there were about 1,000 men who had reached there in destitute circumstances, after much suffering, via "Victoria" routes over the mountains. The rush was too early for the mines, as but little prospecting had been done in consequence of the snow. The old claims were yielding handsomely. Some eighty of the disgusted class returned to Colville, and some would proceed in the direction of Blackfoot.

MONTANA.

From the *Post* of May 26th, we gather these items: The reports from the diggings on Indian creek are very encouraging. A party of three young men, who had run a ditch on to their bar claim, cleaned up $60, after about five hours' run. One of the partners states that though the gulch has been little explored, owing to the high water, yet the bars are good wherever they have been prospected, and they extend more than ten miles....We are sorry to say that immense injury to miners has been done by the high waters of last week. Up at Highland, Judge Potter succeeded, by the greatest exertion, day and night, in saving his claims and one other above him, but as a rule the most of the claims are washed level. Still, the miners are at it again, determined not to be balked.

Hydraulic mining is proving very successful in Alder gulch. Ellis, Blake & Co. cleaned up $2,016 after a run of five days. Not less than ten companies of California miners, and one Missoori company are organized, several of which are already actively in operation....The ditches of the Virginia Water Co. supply 700 inches of water.

The Helena *Radiator* of same date, says Mr. Ed Maclay, of the house of J. J. Roe & Co., arrived in this city from Fort Benton on Thursday evening, and reports the arrival of three boats—the Deer Lodge, St. Johns and Cora—at the latter named place....The whole number of boats will not exceed twenty-five or thirty—being much less than has been reported. ....A gentleman from Indian creek states that a nugget was picked up in the upper end of that gulch during the week, which weighed $87.

The Trinity *Journal* of June 9th, says: Information coming from the Montana mines now is not of as flattering a nature as many had expected. In fact a great majority of the reports received are calculated to dampen the ardor of those who contemplated going there the present season, but had not yet got off.... We learn that letters have been received at Shasta from W. H. Rodehamel, who left there two or three months ago. He writes that Californians who had not the means to go to Montana are in luck.

Don't Drive the Boys from Home.—Mothers who are disturbed by the noise and untidiness of boys at home, must be careful lest by their reproaches they drive their children from home in search of pleasure elsewhere. The Portland *Transcript* gives a case in point:

'There are those balusters all finger marks again,' said Mrs. Cary, as she made haste with a soft linen cloth, to polish down the shining oak again. 'George,' she said, with a flushed face, as she gave the cloth a decided wrench out of the basin of suds, 'if you go up those stairs again before bed-time, you shall be punished.'

'I should like to know where I can go,' said George, angrily. 'I can't go in the kitchen, I am so in the way; I can't go in the parlor, for fear I shall mass that up; and now you say that I can't go up to my own room. I know a grand place where I can go,' he added to himself; 'boys are never told they are in the way there, and we can have lots of fun. I'll go down to Niles' Corner. I can smoke a cigar now as well as any boy, if it did make me sick the first time. They shall not laugh at me again about it.'

And so the careful housekeeper virtually drove her son from her door, to hang about the steps and sit under the portico of the village grog-shop. Do you think she gained or lost?

San Francisco:
Saturday Morning, June 16, 1866.

THE NEW YORK METAL MARKET.—From Winterhoof & Co.'s metal circular of May 1st, we learn that tin bas declined to 21 cents for Straits, 22 to 22½ for Banca. English is quoted at 21 cents, gold. The fall has been owing to nnfavorable advices from Europe and heavy shipments from tbe East Indies. The stock oo band is estimated at from 32,000 to 38,000 slabs, against 8,000 on the 1st of May, 1865, and 52,000 on ths 1st of May, 1864. Ths London market shows symptoms nf still fnrther declins. The price is now lower than for sixteen years past.

COPPER.—No business of importance has been doue dnring ths month. Mauufactnrers are not buying aod holders are unwilling to sell below the oominal quotations of 28 cents for Baltimore, 28 to 28½ for Portage Lake, 29½ for Detroit. A further decline is geoerally looked for. The contioned decline in London has contributed to uneettle the market in New York, althougb it is taken for granted that ths Chile supplies for tbe present year will fall ebort. The price of Chile copper in London is oearly as low now (£81) as the lowest quotation in 1865, (£77.)

LEAD is quoted from 6½ to 6⅝ ceots for ordinary brands; 6¾ to 6⅞ for best Englisb. Market quiet. The stock oo hand is 6,000 tons, againet 5,800 oo tbe 1st of May, 1865,

TORPEDOS IN OIL WELLS.—We nlluded, sevsral months since, to tbe use of torpedoes as an agent for rendering exhausted oil wells agaio productive. They appear to he still quite in vogue, and are performing all that can reasooably be sxpected of them. Who knows but wbat they aight have the effect to bring ioto productiveness some of our California wells, which don't as yet seem to yield mucb. If ordioary torpedoes won't accomplish the purposs, perbaps a good doss of uitro-glycerine oil might work. Who knows? We subjoin the following item from tbe Reoo (Western Pennsylvanian) *Times:*

Torpedoes are gettiog to hs qnite in order oo the Reno Farm, and seem to bs performing all that the most sanguine can expect from them. Ws recently gave an account of ons which wae exploded in the Woodeu well, near the Lady Washington, and which at once increased its production from three to about thirty barrels. Another has recently been most successfully exploded in the Tar Homestead well, which had previously been yielding about two barrels daily. After being subjected to tbis treatment, it immediately commenced pumping at ths rate of tbirty barrels per day, which it still continues to produce. Another well, called the Bumstead, about thirty yards distant, wbich had previously dwindled dowo to almost nothing, and wbich the workmen were actually preparing to abandon, immediately after the shock given to its neigbbor, commenced improving, and is now yieldiog at tbe rate of eighty barrels daily.

PUBLIC DOCUMENTS.—Ws are indebted to Hon. John Conncss for a bound volums of the laet Annual Message of tbe President to the two Houses of Coogress, with tbe reports of the Heads of Departments, and eelections from accompanying documents; also the aonual rsport of the Agricultural Bureau, aod tbe statistics of manufactures of the United States, compiled from the eightb census.

AMERICAN SECURITIES IN ENGLAND.—Of the $22,500,000 ioterest on the oational debt which tbe Secretary of the Treasury had to pay on tbs 1st of May last, fully $6,000,000 were sent to Londoo; showing tbat England already holds mors tban one-fourtb of tbe eotirs fuoded debt of the nation.

IRON.

Gold is called the king of nll metals; bnt iron is universally acknowledged to be the most useful and important subject in the metallic realm. Among the ancients, iron was regarded as the symbol of war; its greatest utility was deemed to be the power which it gave to the nations who understood its uses, over the less civilized nations. Iron is still all powerful in war; bnt its chief power and value consists in the peaceful uses to which it may be applied. It is the ladder upon which the arts and trade and all human industries have mounted to the extraordinary hight which they have reached during the last half century. Gold is presented to man in its natural state almost pure; but iron can be obtained only at the cost of much labor, and before it can be rendered serviceable it must be submitted to the most tedious and skillful manipulations. Iron is not only useful in mechanical appliances, but of all other metals it appears to he the only one which forms a never failiug and indispensable constituent of tbe bumao system, and, iodeed, of all animal life, wherever fonnd.

Iroo oever occurs pure in nature, and indeed is oever found pure anywhere except in the laboratory of the chemist. When so found it is prononnced, on the authority of Stahlcmidt, to be a *pure white metal, and so soft that it can easily be cut with a knife!* As far as our present knowledge extends, no metal is more readily influenced than iron, either for good or bad, by the presence of foreign substances, in minute quantities. A few thousandths, only, of one per cent. of carbon, transforms iron into steel. A larger portion of the eame element converts it into cast-iron. A few thousandths of sulphur or a small percentags of silicium, renders it "red-short," as it is technically called, or brittle when red-hot. An almost infinitesimally emall quantity of phosphorus renders it "cold-short," or brittle when cold. We have already described, in previous numbers of the PRESS, the remarkable hardening qualities imparted to iron by an exceedingly small percentage of manganese nnd tungsten.

Thers are doubtless many persons who have often wondered how cast iron is converted into wrought-iron — how from being brittle and chrystalline in etructure, it is converted into an exceedingly tough and fibrous material — such an ore as can be rolled out into sheets so thin that it requires over one thousand of them to make an inch of thickness. We will endeavor to give a simple and brief explanatioo of this process.

A quantity of pig iron is meltcd in a furnace so constructed that a stout iron bar can be thruet througb an opening into the molten iron. This bar is worked about in the mass, very mucb as a boatman would handle n single oar in a row-lock. After being thus worked about for a considerable time, the metal gradually assumes a plastic condition, and finally aggregates into separate lumps. These agglutinated lumps are then worked together by tbe use of the iron bar aforesaid, uotil the operator has gathered a quantity of from 80 to 100 pounds nn ths end of hie rod. This ball or mass is then pulled to the front of the furuace and hoisted out, put oo a truck and carried to a "squeezer," wbicb clasps and flatteoe it out into a "bloom." This bloom is wrougbt-iron, and is now re-heated in another furnace, and bammered out into any desired shape for commercial usc. Tbe first part of this process is called "puddling."

This operation bas been compared to huttermaking, the manipulations of whicb it resembles more than any other well-known process. Take a quantity of cream and stir it about with a stick, very mucb as tbe molten iron is etirred, and you will have butter. The residue—buttermilk—would be represented in the iron puddling process, by the "slag" which is left as a residue, after scveral "blooms" have bcen taken from the mass. This slag consists mainly of silex, which existed as the principal impurity in ths pig iron.

The convsrsion of cast-iron into steel was formerly a very tedions and expensive process, and until receotly was effected ooly by first converting the pig-iron into wrought iron bars, by the puddling process; the hars were tben packed into proper receptacles with layers of pulverized charcoal mixed with salt and ashcs, covered up from the air, and the wbole mass subjected to about a continuons red heat for two or three days. During this process a small percentage of carbon is found to permeate the heated wrought iron, which is thereby so changed in its nature as to become steel.

During the past few years a great improvement in the manufacture of steel, and an immense reduction in the cost, has been brought about by the introduction of the Bessamer process of manufacture. It is not necessary that we should allude to the manner of this process, in this connectiou, any further than to simply say that by it a good article of merchantnble steel is made directly from the pig-iron, by melting the same in a proper receptaclc, and passing a current of atmospheric air tbrough the mass, thereby performing ths double operation of purifying the iron, otherwise done by the puddling process, and at the same time adding the necessary equivalent of carbon to convert it into steel. Some idea of the value and importance of this discovery may be formed from the following facts:

There are now ecventeen extensive Bessamer steel works in Great Britain. There are at present erected and in course of erection no less than sixty converting vessels, each capable of producing fully 6,000 tons of steel weekly, or equal to fifteen times the entire production of cast steel in Great Britain before the introduction of the Bessamer process. The average selling price of this steel is at least $100 per ton below the average price nt which cast-steel was sold at the period mentioned. With the preseut means of production, therefore, a saving of over thirty millions of dollars per annum is effected in great Britain alone, even in the present infant state of the Bessamer steel manufacture.

THE UNION FOUNDRY.—H. J. Booth & Co. ars now building two large boilers for the steamer Active, owned coujointly by the California Steam Navigation Company and Holladay & Co. These boilers are constructed on the principle of the drop and return flue; whcre the flues after passing the length of the boiler, return to the front aud again pass to the rear, and connect with the smoke chimney. In this manner, n large amount of firs surface is obtained, and the heat is utilized to the greatest possible extent. These boilers are 21 feet long, by 8½ in diameter. They contain each ten flues, of fourteen inches diameter, two of twelvs inches and two of eight. They are being made of the best of material nnd in the most substantial manner, with special reference to avoiding, so far as human foresight and careful construction will do it, any repetition of ths terrible disasters which occurred about a year since to twn of our river boats.

In addition to the above, this foundry is also constructing lor tbe Pabranagat mines, a 5-stamp mill, with engioe and boiler complete, one of Blake's Crushers and a set of Wheeler & Randall's Excelsior Tractory Pans.

Booth & Co., are also turoing out large nnmbers of Hooker's Excslsior Pump—the eame which is illustrated and more fully noticed on the first page of our present issue.

In passing through the works, the past week, we also noticed a large amonnt of miscellaneous work on hand, with which every department of this immense establishmeut appeared to be industriously employed.

THE GOLD YIELD OF OREGON.—The sbipments of gold from Portland through Wells, Fargo & Co., for the first five months of the present ycar, havs been $2,515,150. This amount doce not include shipments direct to New York, nor sums tbat have come forward in private hands. Morcover, it should be recollected that the real amount reported by ths above figures is likely to have been materially uncerrated to save insurance, etc.

TO CORRESPONDETS.—"F. A. H." will appear next week; also a communication from G. Kustel, on the Peat Deposit near the junction of the San Joaquin and Sacrameoto rivers. Edward Pique on the "Source of the Electric Current in the Voltaic Battery"—a very interesting discussion—is on file for publicatioo.

COAL DEVELOPMENTS.

EDITOR PRESS:—After due reflection, I have decided to ask your opinion upon the following subject, which I will explain as briefly as possible: I have every inducement to believe that by expending one or two thousand dollars, a large vein of excellent coal could be discovered. I have found several small threads, and my desire is to bore for the main vein. The location is south of San Jose. I thought of advertising in your paper, stating the main facts of the matter, hoping thereby to induce some gentleman who had the means, to take hold of it. Do you think any one would pay any attention to the advertisement? If you have time, please give me your advice.

We have received the above from a gentleman residing in Alameda county. In reply we would say, that one or two thousand dollars will oot go far in the development of a coal mine. If you have "ssveral small threads" of coal, under proper geological conditions, you have much reason for thinking that you will find a regular vein of coal at a depth of two or three hundred feet. If your ground is so situated that you can develop it to the depth of fifty, seventy-five or ooe hundred feet, either by sinking an inclins upon it or running a tunnel to strike the vein at any of the depths mentioned, at a cost of a few hundred or a thousand or two dollars, you will be able to do much better with capitalists nfter that is done, than to ask their assistaoce at the outset. Boring would be cheaper, bot euch a development would be very unreliable, especially in a coal field which has not beeo previously opened, and from which comparative observations could be made. Capitaliste in California, at ths present time, are not often willing to put money into an undeveloped mine of any kind. They prefer to pay a fair price for a development upon which ths owner has already manifested sufficient confidence to put at least a small sum into from his own purse. If he develops anything of value, there is not much difficulty in finding capitalists to buy his development. In mining for cnal, however, there is so much to be considered, in the way of accessibility to market, that it would be impossible to express an intelligent opinion of the value of a mine without knowing its precise locality—or at least the cost of getting the coal to market. It will cost from twelvs to fifteen thousand dollars to purchase hoisting and pumping machinery, and develop a coal mine to the depth of two hundred and fifty or three hundred feet. You cannot consider a mine anything like fully developed at a less depth than that named. If you wish to bring the matter befors capitalists, we know of no better medium through which to do so, than the columns of ths MINING AND SCIENTIFIC PRESS.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, June 16, 1866.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores whicb assay less than 12 per cent:

	Per ton.		Per ton.
12 per cent. ore	$24 00	22 per cent. ore	$65 35
13 " "	28 50	23 " "	19 10
14 " "	33 00	24 " "	72 90
15 " "	37 50	25 " "	77 20
16 " "	40 80	26 " "	80 70
17 " "	45 10	27 " "	85 00
18 " "	49 40	28 " "	89 10
19 " "	53 70	29 " "	93 25
20 " "	58 00	30 " "	97 50
21 " "	61 70		

To calculate the value of ore which aseaye 30 per cent. and upwards, multiply the percentage by $3.25, and you have the prics which will be paid. For instance, suppose you havs ore which assays 35 per cent., multiply 35 hy $3.25, and you have $113.75 as ths value of tbe ore. These prices, we believe, will be found substantially correct, and can always be realized.

A NOVEL POWER.—A kangaroo is working in a curious apparatus at Melbourne, in which, by continued jumping, he turns a wheel nfter the fashion of a treadmill, and operates a grindstone, a turnip-cutter, a bean-mill, aud a washing machine. He ie rated at about half a borse-power. It ie thought that be migbt also be made to act as a "hopper" for a grist-mill.

GEN. JACKSON ON MANUFACTURES.

The following language. attered by General Jackson in 1824, is as true now as it was on the day on whicb it was spoken, with the additional foren which the thonsands of fertile acres of grain land spread out in our Californiu bruad valleys, and throughout. our Western prairies, must give it. Let thn capitalists of California rend it, and nct wisely in view of thn truth it cortains :

"Take from our agricultore 600,000 mnn, women and children, to he employed in manufactories, and you will at once givo n homn market for more breadstuffs than all Europn now gives as. Wo havn been too long subject to the policy of British merchants. It is time we should become a little more Americanized."

Wn havn nnlimited water-power in Californiu, as cbeap as nny in the world. We have an abundancn of thn ruw material for wool manufacture, and soon shall be amply supplied with home-grown cottun ; or at least with tbat which is grown on the Pucific Const. Let our capitalists bnild ap manufaetories and they will provide a market for our breadstuffs, furnish opportunity for labor, nnd give a new inpetus to industry, nnd the employment of capital generully on the Pacific Coast. For thn information of those who have thought bnt little of tbese things, and who may be curious to know what capitnl employed in mnnufcturos will do, we copy the following statement from tho proprietors of the San Francisco Woolen Mills, which have been running only seven years. The disbursements by the Missiun company have been as follows :

For Californla wool	$1,273,000
For wages	546,000
For Mount Diablo coal	81,000
To machine shops of San Francisco	78,800
To lumber dealers	33 421
To stone and brick makers	24,300
For soap (California)	38,000
For oil	45,000
For leather (California)	6 000
For taxes	45,000

In tbeir statement introduciug tbese statistics, the proprietors say, tbat during the monfb of Janunry last, the pay-roll amounted to nine thousand seven huudred nnd forty-two dollars.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

G. Kustel, of this city,—samples of peat from New York Island, at the junction of the San Joaquin and Sacramento rivers. A full description of this deposit, witb appropriate remarks, will appear next week.

Nitro-Glycerine Fifteen Years Ago.—A friend to whom we had loaned several old numbers of the London *Chemist*, and who has been looking them over dariug tbe past week, has called our nttention to the following puragroph in the issue of that journal for August, 1851. The extract is the substance of some remarks made by Dr. De Vry before the "British Association" for the advaneement of science. Their perusal at this jaucture, will doubtless cause mueh surprise that the information then given bas not been more generally made known to the public :

"This yellow l'quid, nitro-glycerine, seems not to be poisonous, bat it explodes at a moderate heat, as was shown by experiment detonating when the drops of nitro glycerine on paper were struck a smart blow witb a hammer. From tbe conversation held before the association, nitro-glycerine appears like gun cotton, *to have states of apparent inactivity*, which are moved by spontaneous causes ; lor preparations that resist a certain nmount of force applied nt ono time, *may readily explode soon afterwards !"*

Had this peculinr property of nitro-glycerine, whieh wns recognized when the oil was found only in the laboratory, been remembered and kept before tbe public after it became introdaeed as a commercial article for blasting purposes, the late terrible disasters might never have occurred. It would either bave been more carefully bandled. or it would not have been allowed to have found its way into public conveyances at all.

Bullion to the amount of $144,111 was shipped from the Gold Hill, Nevada, express office of Wells, Fargo & Co., duriug tbe week ending June 9th.

Empire Foundry.—Messrs. Flynn & Ffance have entered into copartnership for the purpose of carrying on the foundry business, at 221 Mission street, between Beale and Main streets. They havn excellent facilities for thn manufaetnre of nll kinds of castings. Particular nttention will be paid to light, fauey castings and agricultural implements.

Judicious Resolutions.

Several ol our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the Mining and Scientific Press, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in ono paper, for the ecoaomical convenience ol shareholders and assessment payers, arn meeting with decided success. Those who believe in supporting thn mining cause, shoal! bear our paper in mind, nnd bring ap this subject at the next trustee or shareholders' meeting.

San Fraaciseo, April 7th, 1866.

New Mining Laws of California and Nevada.

We havo just issued, in cheap edition, tho new laws relating to mining and corporations iu California and Nevada, passed in 1865–6. Somo of theso laws are of the highest importanco to parties interested in the matter of locating and holding claims, and prospecting miues, in these States. Copies sent by mail. Price, 25 cents.

Address, Dewey & Co., Patent Agents.
San Francisco, May 1st, 1866.

Mining and Scientific Press.—We received a visit a few days since, from Mr. Wood, agent for the Mining and Scientific Press, who is now canvassing this county for subscribers to that valuable journal. The Press is invaluable to miners and mechanics, being the only journal of any importance on the coast entirely devoted to their interests.—[Mountain Messenger.

The patronage of the public is respectfully solicited. 24v12 ly

Capitalists, Attention!
QUARTZ MILL & MINING PROPERTY FOR SALE
In Nevada County.
A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily-timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam-power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price.
Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear rigid scrutiny, and offers superior inducements as an investment.
For address and further information, inquire of the Publishers of the Mining and Scientific Press, **505** Clay street, San Francisco. 22v12

Money by Mail.—Subscribers and advertisers remitting us money in less sums than $50, can do so by mail at our risk, if they will register their letters; we will take no risk on unregistered letters, or letters by express. Remittances by express must be prepaid.

THE FATE OF THE APOSTLES.—Matthew is supposed to have suffered martyrdom, or was slain in the city of Ethiopia.

Mark was dragged through the streets of Alexandria, in Egypt, till he expired.

Luke was hanged to an olive tree in Greece.

John was put in a boiling cauldron at Rome, but escaped death. He died a natural death in Ephesus, in Asia.

James the Great was beheaded in Jerusalem.

James the Less was thrown from a pinnacle and beaten to death.

Philip was beheaded.

Bartholomew was skinned alive.

Andrew was crucified and pounded while dying.

Thomas was run through with a lance.

Jude was shot to death with arrows.

Simon was crucified.

Matthias was stoned.

Barnabas was stoned to death.

Paul was beheaded by the tyrant Nero.

A CITIZEN of Washoe, recently, when called upon by Uncle Sam's Internal Revenue Assessor, to account for his income, swore that everything he had in the world was on his back. The fellow had strapped his money on his back in order to escape taxation.

Scientific Recreatioos for the Youog.

Every boy in the country that has a koife, l that can get hold of a piecc of willow or s wood, at the season when the bark will eel," is sure to have a whistle. In cities l towns where the proper wood cannot be dily obtained, the toy-shops always have a ply, made of various material, and of differt styles. It is difficult to find a boy that has ver owned a whistle; yet, how few can tell at makes the sound given out by this little strument. We now propose to answer the estion—"What makes the sound of the istle?":

You are probably aware that when you hear e song of the soaring lark, the entire atmosere between yourself and the bird is filled th pulses or undulations, or air waves, as ey are sometimes called. All these waves e set in motion by the little songster's organ voice. This organ is a vibrating instrument, y much resembling, in principle, the reed of clarionet.

Again, when you strike a piano wire, or brate a violin string with your finger or a bow, u will observe that the string vibrates. This bration of the wire or string communicates ilar vibrations or waves to the atmosphere: ese waves pass on to the drum of the ear, and rike or vibrate that just as rapidly as the ring or wire is vibrated. We, in reality, *feel* e motion; but we call it *sound*. Short, light rings make quick, small vibrations, which we ll high sounds; although they are really no gher than the slow and large vibrations of a ng, heavy string, which we call a low sound. e call them high and low for convenience, erely in order to associate them with the es of the musical scale on which they are pressed by means of musical characters.

Now, in wind instruments, like the organ, te, horn, bugle, *whistle*, etc., we have a colmn or tube of confined air, which stands in he place of the piano or violin string. We ibrate this column of air by blowing across ne end of it—not directly down upon or into t, as that would not cause its vibration. In he flute, for example, we make faster or slower ibrations or sound waves, by opening and hutting little holes along the column of air in he instrument, thus shortening or lengthening he same just as we do by passing the finger p and down the violin strings. (In the piano ve have the strings made permanently of all he lengths requir d for producing any sound, igh or low.) When we lengthen or shorten he column of air in the flute, it will vibrate aster or slower. So in order to make different ounds with a whistle, we must lengthen or horten the column of air in the barrel of that nstrument.

The reader will, by this time, understand what makes the sound in the whistle. It is, of of course, the vibration of the column of air in it, precisely as the vibration of the string makes the sound of a violin or piano.

Un-top the lower end of the whistle, and put it into water to the depth of one or two inches. The pressure of hard blowing drives the water down, and the length of the column of air is raised sufficiently to give the different notes of the bird. If held aright, the bubbling out of the air at the bottom interrupts the sound, and makes the trilling that is so characteristic of the songs of birds. With a small, long whistle, a person can, with a little practice, very clearly imitate the singing of a canary bird, bobolink, etc. Little glass whistles, made especially for this purpose, are often met with in the toy shops; but any small whistle, which the boys can make, will answer the same purpose, if the lower end be left open. Different sizes and lengths give different sounds. The lower end of the whistle can be conveniently held in a cup of water, raised as high up as the chin. We presume that all the readers of the Youth's Companion, who have not heretofore learned the philosophy of musical sounds, especially that of the whistle, will hereafter enjoy the music of that instrument much more than they have heretofore done.

A Beautiful Experiment.—Fill a wide-mouthed glass jar with water, and cover it over with a piece of "foundation," (the ladies will understand this), cover that with a layer of peas, pressing it down so that the peas will lay under water. They will then swell and sprout, the roots growing down into the water, their fine fibres presenting a beautiful appearance. Set this into the window, and vines will grow up which can be conducted to the sill. The whole is very handsome.

Dr. Lage, of Lyons, France, has made a discovery of questionable utility—the artificial production of wens. As usual, the unfortunate rats are victims of this new phase in the development of science and human progress. The wens are produced by the introduction of certain metallic sulphates, and the philosopher has succeeded in conferring some remarkable ornaments of this description on his four-footed fellow animals.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. Kimball, J. R. Murphy.

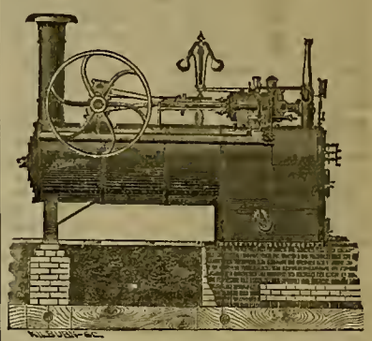
Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make.

HOADLEY'S.

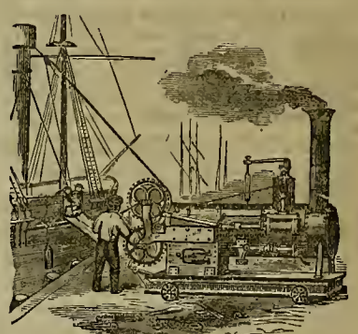
FOUR SIZES,

8, 10, 12, and 15-Horse Power,



HOADLEY'S.

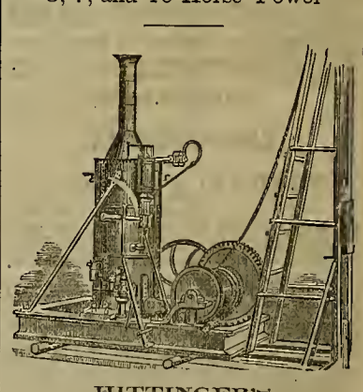
3 to 40-Horse Power.



HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power



HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURability, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by **TREADWELL & CO.,**

18v12 Corner of Front and Market streets.

Occidental Homestead Association,

Office, 305 Montgomery street, San Francisco.

Capital Stock : : : : : : : $33,600

102 Shares, $33 Each.

THIS ASSOCIATION was formed to enable its members to obtain desirable homestead lots in this city, at a cheap and easy rate, paying for the same by regular monthly installments. For this purpose they have purchased blocks 499, 500, and 501 in the Western Addition to this city, bounded by Devisadero, Pine, Broderick and Clay streets. Subscribers will pay an initiation fee of $5 ou each share taken, to form a fund for defraying current expenses, and $11 per month for thirty months, commencing in April, 1856. The property is within three blocks of the Turk Street Railroad, is nearly all on the grade, and is most desirably located for homestead purposes. It is directly east from the lands of the California Homestead Association. The property has been purchased on very reasonable terms, and offers a rare opportunity for investment. A number of fine houses are in process of erection, and streets are being graded near this property, which will greatly increase its value.

When twelve monthly payments have been made, the property will be divided among the members in the usual manner, and each shareholder will receive a contract for a deed to the lot or lots to which he may be entitled, and have the privilege of taking immediate possession of the same. The lots average 27 feet in front by 120 feet in depth. The whole amount due upon any lot may be paid at any time, and discount at the rate of 1½ per cent. per month will be deducted therefrom. Persons wishing to visit the lands of this Association will take the Turk street cars to Devisadero street, and thence go northerly along Devisadero to Pine street.

$20,000 of the capital stock is taken, and the books are open for subscription to the balance, at the office of the Secretary, where the Official Map of the Association can be seen, and all particulars obtained.

The Title to this property is perfect.

J. S. LUTY, Secretary.

Office 305 Montgomery street, corner of Pine, Rooms 2 and 6. 20v12-tf

Pacific Mail Steamship Co's
THROUGH LINE TO NEW YORK,
Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 18th** and **30th** of each month that has **30** days.

On the **10th, 19th** and **30th** of each month that has **31** days

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. R. Co.'s steamer for Central America.

Departure of the 30th connects with English steamer for Tumaco, the port of the new mines.

The following steamships will be dispatched on dates as given below:

June 9th—GOLDEN AGE.....Capt. E. S. Farnsworth, Connecting with Costa Rica, Capt. Bradbury.

June 18th—CONSTITUTION.....Capt. F. R. Baby, Connecting with NEW YORK, Capt. Gray.

June 30th—GOLDEN CITY.....Capt. Jas, T. Watkins. Connecting with ARIZONA, Capt. Manry.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Rheumatism ! !
READ IT! READ IT!!

SACRAMENTO, April 16th, 1856.

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITing I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial.

Yours truly, GEORGE TAYLOR.

☞ RICHARDS' REMEDY is for sale by

H. BOWMAN,
Druggist, Sacramento.

Price, $2 50 per Bottle. 20v12

Commercial Academy for Ladies & Gentlemen.

NO. 111 K STREET, SACRAMENTO, CALIFORNIA. Established in 1853, where students can acquire a thorough business education. Double Entry Book Keeping, Practical and Ornamental Penmanship and Drawing, Latin, French, the Common and Higher English Branches, taught on reasonable terms. Students from any part of the State can procure board and lodging in private families, near the Academy, at from $4 to $6 per week. For terms, address, MART TAYLOR, Principal; Miss SARAH J. WEIR, Associate Principal. 20v12

The Great Pain Annihilator.

DR. E. R. JOHNSON WILL WARRANT TO CURE ALL cases of Asthma, Fever and Ague, Catarrh, Sore Throat, and Womb Diseases. The Doctor's success is miraculous in cases of RHEUMATISM, NEURALGIA, CONSUMPTION, GOUT, PARALYSIS, INFLAMMATION OF THE EYES and all other diseases that human skill can reach. Rheumatic Pains removed in five minutes. Some of the afflicted that visit him come from one to six hundred miles, and soon find relief. Persons at a distance can be cured at home by addressing a letter to Dr. Johnson, No. 700 Market Street, San Francisco, stating case, symptoms, length of time the disease has continued, and have medicine promptly forwarded to any part of the country, with full and plain directions. ☞ Consultation by letter or otherwise, FREE. 16v12-1m

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of May, 1866, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, T. A. MUDGE, 628 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 26th day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. A. MUDGE, Secretary.

Office, 628 Clay street, San Francisco. my26

Old Colony Quartz Mining Company.—Location of Works: Austin, Reese River, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of May, 1866, an assessment of three (3) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, No. 523 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 18th day of June, 1866, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 9th day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. O HOWARD, Secretary.

Office, 523 Montgomery street, San Francisco. my19

Office Providence Gold and Silver Mining Company.

NOTICE.—The annual meeting of the Stockholders of the above Company, for the purpose of electing Trustees, and transacting other necessary business, will be held at the Office of the Company, No. 10 Government House, San Francisco, on the 20th day of JUNE, 1866, at 2 o'clock P. M. of that day.

F. T. FOLSOM, President.

J. M. BUFFINGTON, Secretary.
San Francisco, May 19th, 1866. my19

Sierra Valley Gold and Silver Mining Company, Plumas County, California.

NOTICE.—There are delinquent upon the following described stock, the several amounts hereafter set opposite the names of the respective shareholders, on account of assessmout of one (1) dollar per share levied on the 26th day of April, 1866, as follows:

Names.	No. Certificate.	No. Shares.	Amount
Ansous, V	151	5	$5 00
Ansous, V	158	10	10 00
Bonemeieoni, A	162	10	10 00

And in accordance with law, and an order of the Board of Trustees, made on the 20th day of April, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at Maurice Dore & Co's salesroom, 327 Montgomery street, San Francisco, Cal., on the 29th day of June, 1866, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. L. BIBBINS, Secretary.

Office, 305 Montgomery street, San Francisco. je9

Union Mattole Oil Company. Location of Works: Humboldt County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth (4th) day of June, 1866, an assessment of five dollars ($5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Treasurer, W. C. PARKER, No. 608 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the sixteenth (16th) day of July, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth (20th) day of August, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. WINTER, Secretary.

Office, No. 608 Montgomery Street. jy9

Yankee Blade Mining Company, Reese River Mining District, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of May 1866, an assessment of twenty-five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 329 Montgomery street, San Francisco, Cal.

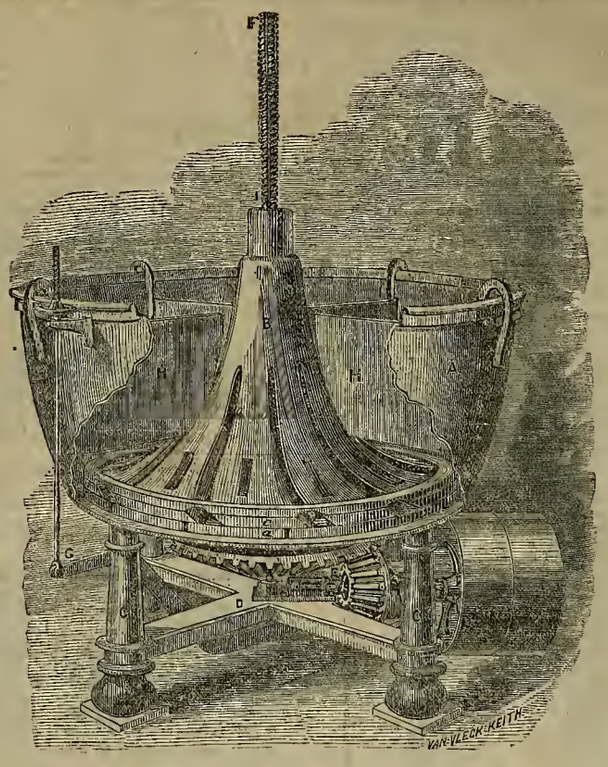
Any stock upon which said assessment shall remain unpaid on the 18th day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the ninth (9) day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. T. ATWOOD, Secretary.

Office, No. 329 Montgomery street, San Francisco. my19

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,



The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

BRUCKNER'S

Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED after an improved mode of construction; which

GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxydizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

will soon be more fully described and illustrated in the columns of the MINING AND SCIENTIFIC PRESS.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,
19v12 416 Market street, San Francisco.

Machinery.

SAVE YOUR MONEY AND BUY,

For $100!

HUNTER'S

Premium Concentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY improved and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 130 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 118 Washington street, below Davis, where ALBERT JACOBS will fill their orders promptly.

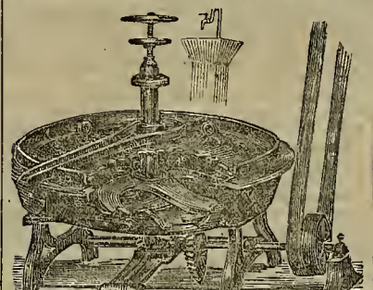
13-v12

BAUX & GUIOD'S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

Hungerford's Concentrator!

—FOR—

SAVING GOLD, QUICKSILVER,

—AND—

SULPHURETS.

MORGAN HUNGERFORD HAS MADE IMPORTANT improvements on the original HUNGERFORD & PRATER CONCENTRATOR, whereby the construction of the machine is simplified, and its operations rendered more complete and easy. It is made more effective by being self-discharging, and delivering the sulphurets more free from sand and dirt.

The Machine can be seen in operation at the Miners' Foundry, 21 First street. Call and examine for yourselves before accepting the opinions of persons more or less interested in other machinery.

Hours from 10 to 12 M. and 1 to 3 P. M.

It should be borne in mind that Mr. HUNGERFORD is the original builder and maker of the celebrated PRATER CONCENTRATOR, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

The new Concentrator will soon be illustrated and described in the MINING AND SCIENTIFIC PRESS.

Address: M. HUNGERFORD,
22v12-tf Miners' Foundry, San Francisco.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

4th.—The rapidity of its working and the quality of the work done.

5th.—The Self-adjusting Tension.

The "Florence" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "Florence" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "Florence" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

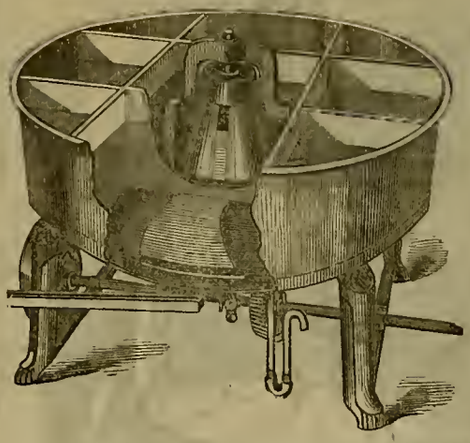
Send for Circulars and Samples of Work.

SAMUEL HILL, General Agent,

20v12-14w 111 Montgomery street, San Francisco.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of eight years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

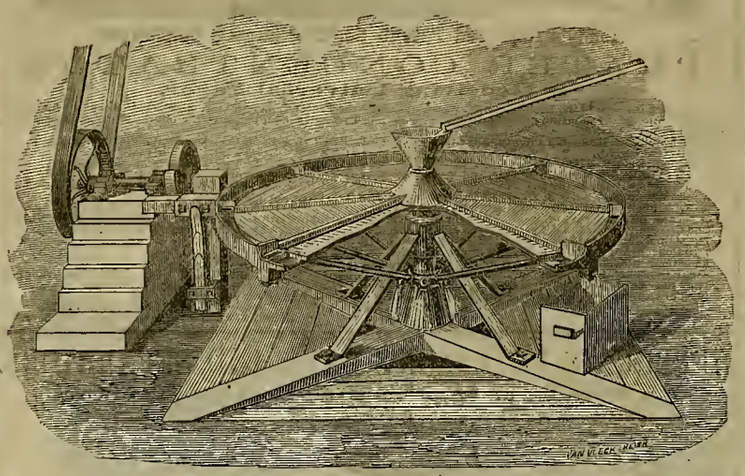
4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

☞ For further particulars, inquire of ISRAEL W. KNOX, or W. A. PALMER, Inventors,

14v13-p12q At the Golden State Iron Works, No. 19 First street, San Francisco.

VARNEY'S CONCENTRATOR,



With a disk 4 1-2 feet in diameter—total weight of Machine 350 pounds.

Is driven by one-eighth of a horse-power, and will concentrate eight tons of ore per day, and make the sulphuret clean. Larger ones do work in proportion to size.

☞ IT CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS, SAN FRANCISCO. ☜

REMINGTONS'

ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a top strap or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

NEW MINING PUMP.

Excelsior Double-Acting Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill horse, or steam-power.

No. 1—Cylinder 2½ in., stroke 6 in.
No. 2—Cylinder 3 in., stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No. 5—Cylinder 6 in., stroke 18 in.

The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,

12v12-3m 120 Front street,

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

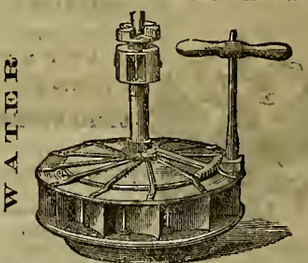
Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY,

1v1 San Francisco.

LEFFEL'S

American Double Turbine

WATER WHEEL.



THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per min., what fall you have, and what power you require. Write or send for circular to

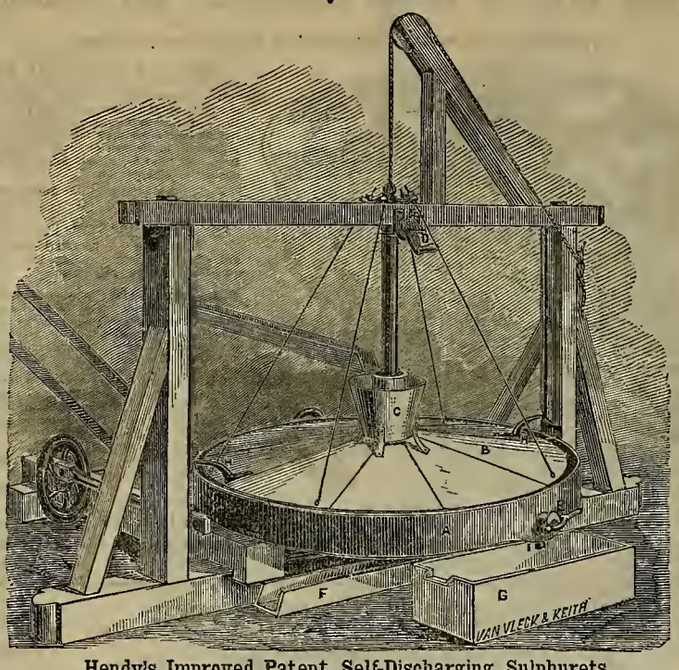
NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets
PRATER CONCENTRATOR
Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
OPHIR O. & S. M. CO., Newcastle, Placer County.
CONEY MILL, Jackson, Amador County.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:
One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Eight Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Dodge & Bro, San Francisco.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.
☞ For explanation of the above engraving, and other particulars, send for a Circular.

California Academy of Natural Sciences.

REGULAR MEETING.

Monday Evening, June 18, 1866.

Vice President Stearns in the Chair.

Fourteen members present.

Minutes of previous meeting read and approved.

The following gentlemen were elected resident members: Ferdinand Von Richthoven, Ph. D., E. B. Dorsey, W. W. Palmer, W. S. Keyes, M. L. Stangrom, J. T. Watkins, Louis Falkeman, and A. J. W. Harford.

Messrs. Vitue Wackenreuder, Thos. Price, E. Wertheman, and Sherman Day, were proposed for resident membership.

A letter was read from Dr. Ferdinand Stoliczka, of Calcutta, Paleontologist of the Survey of India, acknowledging the receipt of his notice of election.

On motion, an appropriation was ordered for the purchase of alcohol.

Mr. H. G. Bloomer stated that he had identified the pepper tree of our gardens as the *Schimus mollis* of authors.

Mr. W. H. Dall called attention to several singular errors in the chapter on Geographical Distribution in Agassiz's new work, "Seaside Studies in Natural History," such as referring to San Francisco bay as a "*fresh water estuary*," calling San Diego an island; and denying the existence of harbors on the coast south of San Francisco to Cape St. Lucas.

Mr. Stearns remarked that he had collected fifty-seven species of mollusks at Ballenas Bay, in an hour and a half.

Dr. Gibbons stated that he had so far failed to obtain any satisfactory proof of connection between the phases of the moon and the state of the weather; a statement which Mr. Asburner remarked coincided with the deductions of Arago and other astronomers.

Mr. Dall announced that the building containing the collections of the Chicago Academy of Sciences was burned June 9th, and serious loss sustained. He offered the following resolutions, which were adopted:

Resolved, That the California Academy of Natural Sciences deeply sympathize with the Chicago Academy of Sciences in their late misfortune, and sincerely hope that it may be followed only by a still greater display of earnest progression, and a broader career of usefulness.

Resolved, That a copy of these resolutions be forwarded by the Secretary to the Chicago Academy of Sciences.

On motion, adjourned.

T. H. Bloomer, Recording Secretary.

N. B.—For "219 *specimens*," in the last report for the Press, read "219 *species*."

Migration of Machinery.—Most of the silk machinery that was thrown out of use in Covington, England, by the operation of the high tariff established in this country during the war, has been brought over to the United States and is already in operation.

HUNGERFORD'S IMPROVED CONCENTRATOR.

We give annexed a very correct pictorial illustration of "Hungerford's Improved Concentrator." The improvement consists mainly in an addition of a circular trough, outside of the periphery of the ordinary Prater Concentrator, into which the sulphurets are discharged from the main body of the machine, and from which they are again discharged into any convenient vessel, through openings shown upon the right hand of figure 1, and which can be kept either closed or open. Both discharges are produced by the action of the machine itself.

The working of the Prater concentrator is too well known to our readers, and has been too often described in the columns of this paper to need any further notice here. The present improvement by Mr. Hungerford, is quite distinctly shown in the perspective view of the machine, as seen in figure 1. The principle of the action of the machine, and of the new improvement, may be observed in the sectional view, as given in figure 2. Another important feature is the means by which the oscillatory motion is imparted to the pan. This is accomplished by two eccentrics, placed on a horizontal shaft passing across and below the center of the pan, and working between the two pairs of adjustable wooden guide blocks or bearings. These two eccentrics are so turned that their sides converge at all points to one common center, by which they are made to bear even upon these wooden blocks or bearings. The result of this arrangement is to obtain an eccentric motion, doing away with all rods, cranks, etc.

The lighter portion of the sand or waste is represented by the coarse dots at 2, 2. This sand works its way out of the machine through the central opening in the same. The sulphurets are forced by the oscillatory motion of the machine to accumulate about its circumference, at 1, 1. A small opening will be seen through the inner wall of the pan, through which the sulphurets readily pass from the main body of the machine to the circular trough, 3, 3, already described, as constituting Mr. Hungerford's principal improvement. These openings are placed at intervals of a few inches, entirely around the circumference of the pan.

It will be observed that the sulphurets in the trough, 3, 3, are maintained at the same elevation as the sulphurets and overlying sand in the body of the pan. It will be further observed that by no possible means can the sand in the latter pass to the former in such quantity as to form any considerable percentage of the amount saved. The advantages of this improved pan are continuous action, requiring no attention except to remove the receiving vessels as fast as they are filled from the openings shown on the right of figure 2, simplicity in construction, and durability and cheapness of cost. These pans are made at the Miners' Foundry, on First street, where they may be seen in constant operation, and where the inventor, Mr. Hungerford, can also be seen and consulted. Application for letters patent from the U. S. Government has been made by Mr. Hungerford, through the Mining and Scientific Press Patent Agency.

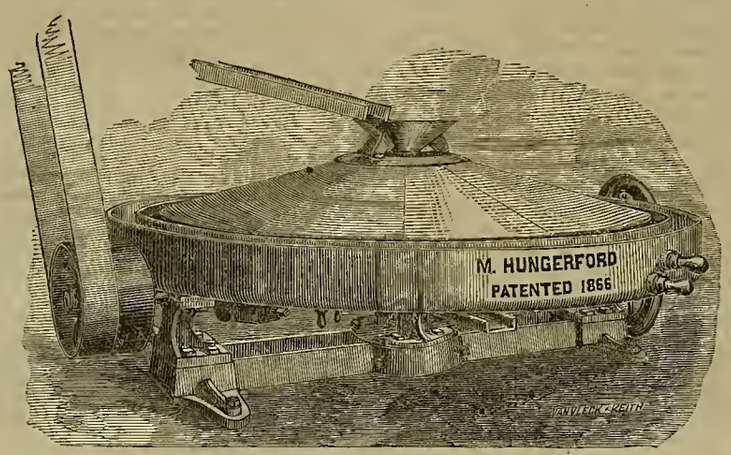

FIG. 1—HUNGERFORD'S IMPROVED CONCENTRATOR.

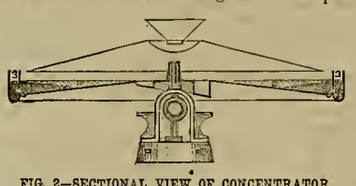

FIG. 2—SECTIONAL VIEW OF CONCENTRATOR.

California Merchandise Exports.—A review of the merchandise exports of California, for the past ten years, presents much that is encouraging to the future growth of the commerce of this city. Our exports to the East consist almost entirely of articles of domestic produce, such as hides, wool, wine, barley, ores, quicksilver, etc. The export of hides shows a steady gain during the time specified. The same remark will hold good of the wool export, up to the time we commenced manufacturing our own woolens. The increase in the value of our exports to New York and Boston, has progressed quite steadily from $1,113,500 in 1856, to $6,159,100 in 1865. Over two-thirds of the whole amount of gain has been made during the past five years. Our commerce with foreign countries has been equally satisfactory—the only exceptions relate to our trade with Mexico and British Columbia. The cause of the decline with the former has of course been due to the unhappy political state of that country, which must at longest be but temporary. The mining excitements in the latter country will account for the fluctuations there. The present annual amount of our exports to British Columbia are about $1,250,000 in value; to South America, about $500,000, and to all other places about $520,000—making a grand total of nearly $8,500,000. For the present year they will be largely increased by the enormous grain crops, which are now almost ready for the sickle, and which, if shipping is found to take them away, will add several millions to the aggregate value of the shipments of 1866-7.

Medical Topography of California.—We have received a copy of Dr. Logan's "Report on the Medical Topography and Epidemics of California; extracted from the transactions of the American Medical Association." It is a continuation of a previous similar report, by the same author, on the diseases and meteorology of the Sacramento Valley, from 1849 to 1858. The subject is one of the greatest interest; yet an unaccountable indifference in regard to it, seems, according to Dr. Logan, to have been shown by the majority of medical men in the State. Widely distributed circulars soliciting the co-operation of these gentlemen, met with "few and meager responses;" although a couple of hours' writing from each would have been of material assistance. The author therefore only claims for the pamphlet that it describes these phenomena in a general and imperfect manner; expressing a hope that it is only a step towards a more full and systematic reconnoissance of a region like California, which is in this respect a world within itself.

"F. A. H."—We are always pleased to hear from "F. A. H.," however much we may differ from him in opinion. Our correspondent is mistaken in supposing that we understood *him* to say that the "auriferous gravel deposits" are of a post-tertiary age. We did not, at the time, know what his opinion was; but we took it for granted that those deposits were to be referred to that age. In our qualification we merely intended to express the possibility of a misunderstanding with regard to what "auriferous deposits" he referred to in his communication. We should be pleased to hear more particularly with regard to the "cave of quartz" to which he refers in his private note. Does the superincumbent gravel have the appearance of having been disturbed by it?

Charge of Destroying Mining Records.—The Reese River *Reveille* of June 4th, says that C. L. Straight was arrested on Saturday by officer Bodrow, on a warrant issued by Justice Harmon, on the charge of destroying the records of claims in the Philadelphia district, which he subsequently organized as the Silver Bend district. After completing his infamous work, Straight located a number of ledges in the new district by right of discovery. As the act was committed in Nye county, he was held to bail in the sum of $1,500 for his appearance before Justice Bowman, at Ione City, on the 15th instant.

Queen Victoria teaches a Bible class every Sunday.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

California Peat or Turf—A Future Fuel for Technical Purposes.

Editors Press:—New York Island, in the San Joaquin river, below Antioch, belonging to W. M. Brown, contains about 800 acres of evergreen land, which assumes now the shape of a productive farm. Fruit trees, vegetables, strawberries, etc., recently planted, grow admirably in a soil formed by a bed of peat of late formation, and still progressing. How deep this turf extends is not known, but five feet below the surface it does not look much different from that at the top. The bed extends not only over the whole island, but also through the other islands near by, and probably also the greatest part of the tule and swamp-land along the Joaquin may be formed by peat.

The New York Island turf is an accumulation of vegetable matter, in which roots predominate. When perfectly air-dry, one cubic foot weighs thirty-four pounds, sufficiently compact for any use. Mr. Brown pressed a piece, taken three feet below the surface, under an ingenious cheese band-press, of his own manufacture, quite easily to a compact brick, thereby reducing the volume to nearly one-third.

A blow-pipe analysis showed the following compound of an air-dried sample:

Hygroscopic water	13.00
Combustible gas	46.70
Carbon	21.80
Ashes	18.30

The adhering water shows a very small percentage, and is probably due to the California climate. The ashes are composed principally of silicia, with a small proportion of iron, clay, lime and sulphur.

The European sorts of peat contain an average of twenty-five per cent. of water when air-dry. The value of the peat depends a great deal on the quantity of adhering water, by which the burning effect is considerably modified. The New York Island turf produces from eleven to thirteen times its weight of lead, which gives a caloric power of 0.33 to 0.88 (taking that of carbon=1). Wood, with twenty per cent. water, has 0.36 caloric power—a little higher than that of the turf. There are other kinds of turf, with a small percentage of ashes, which surpass the wood in regard to caloric power. The French turfs used for technical purposes reduce from eight to seventeen parts of lead; the sorts on the Harz, eleven to eighteen; those in Saxony eleven to eighteen.

The air-dry turf furnishes a moderate heat for calcination of different stuff, roasting of ores, under seething kettles, and for cupelation of lead. It is used in a raw and charred condition with other fuel in furnaces for smelting iron ores; but the most important use of the peat is for puddling and welding furnaces after being converted into gas. About twenty years ago I built a turf gas-welding furnace, which gave a splendid white heat for welding of old rails.

The turf-gas furnace is very simple. Seimon's method of utilizing the heat after it passed the furnace (described in the Mining and Scientific Press, June 2d, 1866) is very ingenious, but the advantage is not so striking as it seems. Firstly, it is not necessary but even wrong to build the gas generator so far off from the furnace that the gas on its way cools so much as to require heating again, except the gas is taken from an iron ore-smelting furnace. Another defect of Seimen's furnace is the want of a fire-heating place for the material which in this case has to be charged cold. What is gained by the brick chamber is partly lost again by cooling down the furnace with a cold charge. It makes a great difference in time for welding, whether, for instance, puddling bars are introduced cold or red-hot. The heat cannot be uniform, using the brick chambers, as gas and wind consume by degrees the heat, being then at the end of the half-hour, after which the chambers have to be changed a great deal cooler than at the commencement. For welding purposes the irregularity of heat is most provoking.

Artificially-dried peat is also employed directly for puddling of iron, but it is less suitable for blast-furnaces, partly on account of the high amount of ashes which the peat generally contains, and also on account of it not being solid enough, but the loose condition is again favorable for the gas generator. The carbonic acid produced above the grates transforms perfectly into carbonic oxyd.

At Brown's Island the turf could be taken out easily to the depth of five feet, although the tide is considerably there yet.

San Francisco, June, 1866. G. Kustel.

[Written for the Mining and Scientific Press.]

Mining in Reese River.

Editors Press:—I am much pleased to assure you that our shipping report shows a marked increase in the shipment of bullion of late days over that of former times, showing that all that is necessary to make this country productive in bullion is the proper application of money. Capitalists are now beginning to see their past follies and extravagances, the suicidal manner in which they have invested; doing so, in many instances, without even glancing at their purchases, and always too ready to place dependence on their own judgment.

The theory (if it be theory) that experience is the only teacher of the science of mining is beginning to dawn upon them, and some seem to have a proper appreciation of the ability of practically-taught miners, though in most cases acting in regard to them in only a half-way measure—their object being economy; but in their manner of economizing they show their utter ignorance.

If "economical-meaning agents" would engage practical men, at a reasonable salary, as superintendents of their mines, instead of undertaking the duties themselves, or placing in such position some friends or relatives who must have a position, much more economy would be shown.

There are a thousand and one extravagances and misapplications of money shown in inexperienced men mining that would be avoided, and much valuable time saved, by using judgment through proper knowledge of the work. It would be far better to pay a good salary to men having a knowledge of mining, and through them accomplish something, than to pay the same salary to one inexperienced, and through him contract immense liabilities, besides leaving his work in such a position that it is of no further use, and must necessarily be done over.

How many instances there are here where there have been thousands of dollars expended in mining, and to-day the owners are no nearer the consummation of their hopes than the day they organized their companies. The country is dotted with such instances; go where you will you will find them. After the harm is done, and their own inability proven up to them, by ill-success of their different enterprises, and money for further development is getting scarce—their energies worn out through ill-success—to them a blank, unproductive future is ever present. They shut down, cease all operations, and "Wilkins Micawber-like" wait for something to turn up. There lie their mines, on which there has been much money expended to no purpose, their mill "hung up"—no more rattling of machinery and hammering of stamps for a time. What are they waiting for? For advices from their Trustees in the East, or the arrival of the President of the company, when it will be immediately decided what will be done. The President does arrive, and sees the mill and mines, and traces of something that has been undertaken to have been done; but sees it not in the light it actually is. He does not have the remotest idea of the cause of the failure of the enterprise. Is it money? No! if it were, he has an abundance at his command; and, in truth, he will never learn the cause of the ill-success of his company, because of getting all his information in the matter from those having bad charge, and through whose ignorance and inexperience the enterprise has proven so far a failure. With them alone he consults and exchanges ideas, giving them the credit not due them, of having a knowledge of mining, acknowledging utter ignorance upon the subject himself. His main object being to fix things up and get back home; so as a saving clause it is mutually agreed to get a new superintendent; it may bring them luck. The new superintendent is at hand, having been so constituted before sailing for the field of his labors in company with the President. It looks to me "like stepping out of the frying-pan into the fire" to make any such change. But the company want a change of officers, and this new hand being in delicate health at home, it is thought a change of air and scenery will improve him; or he may be a dear son of some dear friend who is a member of the corporation. There are a thousand reasons why he should have the position. He will be far removed from the temptations and seductions of a city life; his morals will be bettered in the change, besides not drawing so heavy on his dear patron's private purse; so the change is made, and, in reason, ask to what purpose?

Can this blindness to self-interest ever exist with the owners of our mines? Is there no possible way to open their eyes to the ruinous course they are pursuing thereby—not only engulphing themselves, but dragging with them, either through total ignorance of purpose, or through sinister motives, the reputation of the country as a mineral region, and also the dearly-prized remnant left to the masses—"the hope of a bright and prosperous future for our country?" The state of mining affairs is, indeed, discouraging to one looking at it practically.

It must be remembered that there are between seven and eight thousand souls to feed in this section. There are, also, two and a half million of dollars standing charged to the country for mills and machinery alone. Our bullion shipments, until lately, do not foot up over $30,000 per month. It shows on its face that the country is not self-sustaining, that it is getting more deeply indebted daily. Neither does it produce enough to feed its population, aside from paying the indebtedness of $2,500,000 already invested, standing in useless mill property, as a living monument to the folly and ignorance of the heads of such enterprises; and, too, the interest and accruing interest and accruing expenses must be paid from the products of the country; and, again, two-thirds of the gross amount of bullion shipped must be charged to said bullion, as expense of mining and milling the ores from which it was extracted.

Mineral is here, and in abundance, which no one questions for a moment who has taken the trouble to be observing. I might here make mention of the Yankee Blade mine, situated in this district, about two miles north of this city. This mine has been worked of latter years by a "miner," (E. McVicar,) a thorough miner, having gotten his experience through the constant use of mining implements for the last thirteen years or more. Under his management the mine has, after much labor, been made productive. His work is all done in a permanent and workmanlike manner. I would refer the inexperienced wishing to get a knowledge of mining to his manner of working, whose plans, if they follow, will earn them much more credit than by working after their own ideas. There are now about seventy tons of the ore at the Midas, or New York and Reese River company's mill, from said mine, and in course of reduction, which ore will average $300 per ton gross. If all companies would adopt the same plans of working, and use the same energy that this company has in all their enterprises, there would be a vast difference in this country for the better.

Rich and immense lodes are being discovered daily. More excitement and energy is being shown in discovering new ledges and forming new mining districts than in the early days of the country. The new discoveries made in Nye county, in and about Twin River, Hot Creek, Philadelphia district, and other adjoining districts, are proving rich and extensive, far beyond the expectations of the discoverers. Much excitement prevails here in regard to the mines of the Philadelphia district. It is situated seventy-eight miles southeasterly of this place, and judging from reports and the interest moneyed men are taking in it, there must be something above the average veins found.

The fact of larger and better defined ledges being found elsewhere than in this immediate vicinity, will cause much speculation with those having mills here who have as yet accomplished nothing in their mining, with regard to the removal of their machinery to those districts, where ores can be found on the surface, thus obviating the necessity of mining; and I am of opinion that, ere long, many of our heaviest companies will be interested to such an extent in outside districts that they will, as a last resort, remove to them. It would be even better for the country did they, as there are few of them doing any good here, while a change of location may be advantageous to them as well as to the people at large. Bullion, and in abundance, is our only salvation, not only to the general advancement of the country, but to give encouragement to those already deeply interested, and to those desirous of investing, but dare not, they seeing that their neighbors meet with no success or returns. Let capitalists banish from their brain excitability, rooted there through enormous and over-drawn representations made by our anxious sellers. Let common, hard, practical reason have sway for a day, and my word for it, every one will be better satisfied and better paid for the time spent by them in Reese River.

Austin, June 11, 1866. Progress.

[Written for the Mining and Scientific Press.]

Letter from Placer County.

by our traveling correspondent.

[Continued from Page 355.]

Editors Press:—Before reaching this place I had ascertained that a considerable interest had been waked up here a few months previous, by the discovery of copper and some promising lodes of gold and silver-bearing quartz. The fever of excitement—the usual attendant of similar discoveries—has now subsided, giving place to a steadier flame and to organized action. Some ten or twelve companies are now vigorously engaged in prospecting for the precious metals, with much in the way of indications and of actual results to stimulate to further effort. At least five or six locations have been made for copper on a range lying a mile or more to the east of the village, and extending from three to four miles in a northwesterly direction. These claims, unlike thousands of others on the coast, have not been taken up, recorded, and then left, not to be heard from until the next new excitement, but, with scarcely an exception, are now actively worked either by shaft or tunnel. Having accidentally met with a conveyance going directly to one of the best developed of these, situated north of Bear River, my eyes were soon gratified with the sight of copper ore not often seen at the same degree of depth. Here I learned that this mine had been visited only a few weeks before by the senior editor of the Mining and Scientific Press, and that a favorable notice of it had already appeared. It is, consequently, only necessary to state on the testimony of those engaged in its development that it has continued to improve since that date, both in respect to the quantity and quality of the ore.

Madame Rumor, my bosom friend and constant companion, more than once intimated that large sums had been offered and refused for this mine, but as the figures varied by many thousands, we withhold them for the present.

As another season will doubtless do much towards developing and determining the true value of this and the other copper claims of the neighborhood, we devote the remainder of the space to the gold belt situated to the west of these, and consisting of a series of parallel lodes running in the same direction.

The claims here located are the Telegraph, Imperial, Montana, La Fayette, Collax, Woodstock, Rising Sun, and a few others, all more or less opened and advantageously situated within a mile of the Central Pacific Railroad, a fact in itself not insignificant, when the cost for the transportation of heavy machinery is taken into consideration.

A belief prevails extensively throughout the community that these mines lie on a direct range with the Allison Ranch and those of Grass Valley, an opinion based not only on their geographical position, but also on the general similarity in the sulphurets and the striking family likeness in the quartz of the respective sections. The majority of these claims are now being worked, and operations will soon be resumed upon others. The Montana, the first reached after leaving the village, consists of 2,400 feet, and has a shaft of fifty feet. The La Fayette, lying next in order, contains 2,200 feet, and is opened by tunnel of upwards of 300 feet in length, cutting two veins varying from two and a half to three feet in thickness. They have a dip to the east and the usual northwesterly direction. The quartz at the present depth is of the white and bluish cast, containing a good share of sulphurets. Mr. William Hopper, the superintendent, I believe, of the mine, informed me that an assay had been made of some of the rock from near the surface, by Waters & Co., of Sacramento, which ran as high as $47.37 per ton.

THE COLFAX,

Situated immediately across the ravine, and northwest of the La Fayette, was one of the first locations, and consists of some 1,600 feet. The stock is owned chiefly by Messrs. Hurd, Wheeler and others. The company have cut a lode of at least nine feet in thickness, by means of a tunnel of some 200 feet in length, striking the vein at a depth from the surface of about ninety feet, showing a blue quartz and the usual mineral-bearing sulphuret. I learned that some 700 pounds had been worked by

mill process in San Francisco as a test, which yielded about nine dollars to the ton, in gold and silver—the latter preponderating—and that different assays from the same had run from $15.50 to $45 per ton.

On the ravine a short distance below the Colfax, Sutton & Bro. had just completed a small arastra for the purpose of crushing the rock from their claim, the particulars in regard to which I did not learn. Crossing the hill a few hundred yards to the north in company with Mr. P. McMahon, the secretary of the

WOODSTOCK,

Who had kindly tendered his services to show me the different claims of this new and promising district, I soon reached the shaft of the company. It started on two small veins, which, gradually widening, had come together at the depth of twelve feet, making a width of lode at thirty-eight feet in depth of not less than six feet. No assay had been made of the rock, but a good prospect had been obtained in the hand-mortar in the form of free gold. As the quartz is of a bluish color, and similar in texture and in other respects to that of the Colfax and La Fayette, it probably contains also a good proportion of silver. The Woodstock consists of 1,800 feet, and is owned by Mr. McMahon and other citizens of Colfax.

Not far from this, and a short distance to the east, is

THE RISING SUN,

Which, like its great namesake, has an apparent course at present from the east to the west, with quartz of a yellowish line, containing free gold, and well distributed through the vein. The company, made up of Messrs. Coleman, Neff and others, lay claim to some 3,000 feet, and have sunk a shaft to the depth of sixty feet on their lode. I was informed by one of the company that the vein had an average thickness of twenty-two inches. Sixteen tons of the ore was recently worked at the Hausting Hill mill, in the neighborhood of Grass Valley, which crushed at the rate of $27.27 per ton, mostly gold, I believe, and running 907 fine.

A few months more will probably develop many interesting facts concerning the mines of this vicinity, of which you will be duly informed. In the meantime, I remain as ever, your PROSPECTOR.

Colfax, June 6, 1866.

[Written for the Mining and Scientific Press.]

The Auriferous Gravel Deposits.

EDITORS PRESS: "Is it possible for those ancient auriferous gravel beds, situated along the western flanks of the Sierra Nevada, to be intersected by metalliferous quartz veins?" I believe geologists do not claim to know the exact age of metallic veins and auriferous deposits, and I hope you will pardon me if I should not consider the above question finally disposed of. I am at a loss to understand how you should infer that I believe the gravel and cement deposits situated high up on the sides of the Sierra Nevada, and extending from the Feather to the Merced river, are of no more ancient formation than the tertiary period. When Prof. Whitney avers he has found quartz veins intersecting a formation containing mullusca, belonging to the cretaceous or even a much later period, I can readily accept it as truth; but if he or any other man jumps to the conclusion that those ancient gravel deposits, above referred to, are of as recent formation as the cretaceous period, he may find there are things he does not dream of in his philosophy. While writing a communication, which appeared in the columns of the PRESS, under the title of "Age and Formation of Igneous Rocks," I did have a sort of a general idea that no auriferous ores found their way to the surface earlier than the new red sandstone period, and that consequently the auriferous gravel deposits must have been of subsequent formation. My object in writing the above mentioned paper was two fold; first, to show that the earth's crust had become solid to a greater depth than the metalliferous stratum; and secondly, to show what loose ideas scientific men generally have of the formation of igneous rocks, when such scholars as Dr. Jackson are left to infer, that the molten interior of our globe must be of a metallic nature, because, at ordinary temperatures, most metals are more dense than any known rock; forgetting that metals expand more rapidly than earths at an increased temperature! And the readers of that paper will observe, too, that only such facts were used as have been before the world in standard works for years.

Since writing that paper, I have acquired new facts, and have better digested such facts as were then in my possession, and consequently have more definite ideas of the age of auriferous ore (and deposits) and the manner of their being brought to the surface, and have been led to the unavoidably conclusion that these ancient gravel and cement deposits were formed much earlier than the new red sandstone period.

I am very much interested in the description of the formation of Table mountain, by J. A. Jennings, and with him believe "it opens to us an interesting chapter in geological history." If the lava, that forms the mass of the mountain, was of sufficient fluidity to follow a river channel twenty or thirty miles, it must, at the time of its formation, have been level from bank to bank, or in an easterly or westerly direction. Does the surface of the mountain dip in a westerly direction? If so, by determining the angle, the method of ascertaining how much the mountain has been upheaved since its formation, would readily present itself to the mind of the mathematician.

F. A. H.

[Written for the Mining and Scientific Press.]

From Sierra County.

EDITORS PRESS: This once flourishing mining town, by fire and decrease in the value of mines has gone down somewhat; but there are still some good diggings here yet. The Young America claim, on a gravel deposit, has a tunnel 1,600 feet long, penetrating the hill in a southeast direction, which developed a good paying condition. For four years it has been constantly yielding an average of six dollars per man, daily. The tunnel was run at a cost of about two dollars per foot. Mr. H. Holling is the superintendent and one of the principal owners.

THE LEE CREEK DIGGINGS,

Below Forest City, consists of a small claim, but yielding from five to ten dollars to the man per day. For ten years it has been a constant thing, and has preserved its value, while many other larger and at times more valuable mines have run out. It is owned by Mr. Charles Lee and son, two of the oldest residents of this place.

The Live Yankee, at one time so fabulously rich, has failed to give out its immense wealth, and at present, is worked at only enough to pay wages. It is estimated that $1,000,000 has been taken from this mine in the past.

W.

Forest City, June 5, 1866.

CALIENTE DISTRICT.—*Editors Press:* Your correspondent "D.," in writing about the Clear Creek mines, must have been misinformed about the Caliente district. The district is *not* several years old, nor was the mill built several years ago. The district was organized last July, and the mill was finished last January only; and a misunderstanding between the owners was the cause of its stopping. It is now at work again, under Judge Walsh, formerly of Grass Valley, who speaks in the highest terms of the district. Several arastras have been at work there since January, getting from thirty-five to sixty dollars per ton from the rock. The advantages for working the Caliente leads are superior to those of any of the neighboring districts, and the operations of Judge Walsh will soon prove its value.

Professor Blake is now visiting those mines, and we may soon enjoy *his* opinion as to the Clear Creek mining region. When the leads in that region shall be well opened, they will disclose wonderful wealth. Give them but half the development that Grass Valley now enjoys, and they will present unequalled attractions to men of means. The great want is want of means, but they will soon be supplied.

June, 1866. M.

D. —— accepts the correction with thanks.

A WORD FOR LITTLE GIRLS.—Who is lovely? It is the little girl who drops sweet words, kind remarks and pleasant smiles as she passes along; who has a kind word of sympathy for every girl or boy she meets in trouble, and a kind hand to help her companions out of difficulty; who never scolds, never contends, never teases her mother, nor seeks in any way to diminish, but always to increase her happiness. Would it not please you to pick up a string of pearls, drops of gold, diamonds or precious stones, which can never be lost? Take the hand of the friendless, smile on the sad and dejected, sympathize with those in trouble, strive everywhere to diffuse around you sunshine and joy. If you do this you will be sure to be beloved.

THE majority of the Teachers in the Department seem to favor opening the Schools at 9 o'clock A. M. instead of 10.

Mechanical.

Bessemer Steel—Lake Superior Iron.

Various experiments made to determine the tenacity of Bessemer steel, have shown that while wrought iron will bear from 40,000 to 60,000 pounds per square inch, and the best common steel 93,000 to 124,000 pounds, Bessemer steel will resist a pressure about twice that of wrought iron, and nearly as much as the best cast steel. Four experiments with Bessemer steel, as compared with the best common steel, resulted as follows:

No. 1 broke at	117,183 lbs.	per square inch.
No. 2 "	119,043	"	"
No. 3 "	104,283	"	"
No. 4 "	121,841	"	"
Best common steel broke at	121,000	"	"

Bornemau says that the softest Bessemer steel is at least as strong as the best Swedish chain iron, and its strength increases with the per centage of carbon to one per cent., when it is equal to about double the strength of the best chain iron.

Experiments recently made in Sheffield, England, with various kinds of steel, show that the absolute strength of any steel increases as the carbon increases, till it reaches 1.25 per cent., after which it rapidly decreases in strength. These experiments have shown that steel with 0.63 to 0.95 per cent. of carbon, is at least fifty per cent. stronger than wrought iron. Such steel is especially adapted for machinery of all kinds, since it is not made crystalline by repeated jars, as is the case with wrought iron.

In working Bessemer steel, two qualities are observable, which distinguish it from wrought iron; first, it is completely clear of slag, and second, it may be welded at a much lower temperature. When rolled or hammered this steel is completely homogeneous. The rough ingots sometimes have bubbles in them; but since the walls of these bubbles are entirely clear of oxids or slag, they weld together under the rolls or the hammer so thoroughly, that when the bar is broken not the slightest trace of them can be found.

It may not be improper, in this connection to state that the quality of the Lake Superior iron is conceded to be superior to any iron in the world, as is shown by the following analysis, giving the strength per square inch in pounds:

Salisbury, Conn., iron	58,000
Swedish (best)	58,134
English, cable	59,105
Center Co., Pa	59,400
Essex Co., N. Y	59,960
Lancaster Co., Pa	76,969
Com. English and American	30,000
Lake Superior	80,582

A TRIUMPH OF SCIENCE.—As an evidence of the capacity of science to penetrate even to the most minute of the operations of nature, the late discoveries with regard to the nature of blood may be most appropriately referred to. Human science has brought to the knowledge of man the fact that the liquid portion of the blood is colorless, and that its red appearance is due to the presence of innumerable little bodies floating in it, which are so small that three millions of them are contained in a drop which may be suspended on the point of a needle! The microscope has shown us that these minute bodies are corpuseles or sacs filled with a compound substance, and it has been ascertained what both the film of the sacs and its contents are composed of. Each one of these little bodies has its own life. They are formed and grow and die; and it is calculated that nearly twenty millions perish at every pulsation of the heart! The revelations of the microscope have, of late, led us to hesitate as to which should most challenge our wonder and admiration; the magnificent and grand, or the minute and microscopic, among the wonderful works of the Creator.

FITTING THE JOURNALS TO BALANCE WHEELS. A balance wheel which it is necessary to take off from its journal, should have its hub bored out and the hole made tapering. The journal should have a corresponding taper, and a nut on the end for securing the wheel, instead of a key fitting a slot. The taper should correspond with the hole, and should not be more than one-eighth of an inch in the diameter of the hub.

TEST FOR TELLURIUM IN MINERALS, ETC.—The ordinary blow-pipe test for tellurium, in which a sublimate is obtained which melts to colorless drops of oxids of tellurium, is not always sufficiently delicate. Prof. Kobell, therefore, recommends heating the powdered substance with concentrated sulphuric acid. When the reaction first commences the acid becomes red, but when the heat is increased this color disappears. On the addition of water to the red liquid, a blackish-gray precipitate of tellurium is produced, and the liquid becomes colorless. Nagyagite and blatterertz do not give the red color, but a turbid brown liquid which after standing some time appears hyacinth red, and gives the gray precipitate with water.

A NEW GOLD SEPARATOR.—A gentleman of this city, has contrived a new method of separating gold from the dust, by what we infer to be a dry process. It is described as follows: It is made up of a series of sieves, of the same size but of graduated apertures, which are moved with a semi-circular motion, one above the other, and are so arranged as to save the gold, from the coarsest lump to the finest particle. The extraneous matter is separated and thrown out, and the gold is saved at the bottom of the series of sieves.

THE VOLTAIC PILE—REWARD FOR EXTENDING ITS APPLICATION.—Our Paris correspondent informs us, says an exchange, that the Corps Legislative has just adopted the following projected law:

ART. 1.—A prize of 50,000 francs to be awarded to the author of the discovery which will render the Voltaic Pile applicable with economy to the following purposes: To industry as a source of heat, to illuminating purposes, to chemistry, to mechanics, and to practical medicine. The rules to be adopted for the conditions and the judgment of the said competition will be determined by a decree.

ART. 2.—In case that no prize shall have been awarded at the period fixed by the above article, the competition can be prorouged, by a decree of the Emperor, for a new period of five years.

SHAFTING.—When long lines of shafting communicate power, they spring and buckle greatly when the work is variable. The twisting strain tends to wrench the shaft asunder, and causes the machinery to run unevenly. This is often a source of great loss, and the remedy is to put a moderately heavy fly-wheel on the extremity of the shaft, near the hanger. This equalizes the power, so that no change is perceptible, and has been successfully tried in several large cotton factories.

PLATINUM, being a soft metal, is not fit to receive a sharp edge for any practical purpose, except when subjected to a voltaic current, which instantly imparts to it a hard temper, similar to that of steel; but this hardness ceases with the current that produced it. At a white heat (1,500° centigrade), produced by electricity, a platinum blade will cut the flesh through in an instant, and its action may be regulated at present by modifying the temperature.

THERE is now a pretty little steamer on the Thames which runs ten miles an hour without paddle-wheel or screw. She takes in water well forward, and expels it aft under each quarter, and can steer without her rudder, and can stop in less than her length when going at full speed.

RECENT experiments conducted by the Government of France, show that the water-tanks on board ship a should be coated inside with tin, and not with galvanized iron, as at present. It was discovered that the water, under certain various conditions, dissolved the zinc off the iron, and rendered it injurious to health.

IRON ORE has been discovered at Groton, Conn., which yields 75 per cent. of pure iron. The vein, at the point of discovery was two feet wide, but increases to a width of seven feet, with an average thickness of eleven or twelve inches.

ANOTHER CALIFORNIA INVENTION.—Mr. L. H. Wooley, of this city, has made an alleged improvement on the common bridle, having for its design the more easy management of unruly horses.

COTTON IN BARRELS.—Dr. Hutchinson, of Mobile, has adopted a plan of packing cotton in barrels, which the Mobile *Tribune* approves, as one calculated to save at least ten per cent. in cost over the usual mode, besides greatly lessening the expense of freight.

AMERICAN GLASS.—It is stated that in the production of glass for achromatic lenses, the American glass makers beat the world.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, June 23, 1866.

The loan demand for money has improved this week, and more activity prevails in bank and upon the street, hut the requirement is not of sufficient urgency to affect the usual rates of interest for acceptable securities, or to impede the negotiations of parties in good credit. The effect of ths recent withdrawal of at least half a million of dollars, loaned upon mining shares and other collaterals, is subsiding, and it is more than probable that all the capitnl hitherto employed for stock purposes will soon flow into tbe same channels again.

Receipts of treasure from the interior mining districts continue fully up to the usual average, and since last Saturday have amounted to $850,000, making an aggregate of nearly $3,000,000 thus far during the current month.

A good demand still prevails for hullion, although since the sailing of the last steamer there is less inquiry for shipping purposes. Gold Bars may he quoted at 870@880, and Silver at 1½@2 ₱ cent. premium.

Legal Tender Notes have been dealt in to the extent of $90,000, within a range of 72½c, seller 30, @ 69c, seller 30, closing at ahout 71c hid, 72c asked. Quotations for gold in New York, recently have fluctuated violently, and the latest figure (to the 19th inst.) is ahout 160, with a partial cessation in the export demand, and a still further decline prohahle.

The Mining Share Market has exhihited rather more steadiness, and most leading stocks have been less freely offered. Some of these claims, as is well known, are at present yielding handsome profits, and recent developments would seem to inspire tbe helief that they are not likely to become less productive for some time hence, while others, although not yet in a condition to pay dividends, are accumulating a fund for stockholders. Added to this, more economy and hetter judgment has of late marked the management and general policy of different companies, and dealers in these stocks can now feel thnt their interests are judiciously protected by honest and capable officers.

City Shares are attracting more attention, and for the most part at higher figures. Spring Valley Water was sold at $68@$61 per share, and is now offered at $63. This Company propose to issue bonds in the sum of $500,000, bearing 10 ₱ cent interest per annum, in order to replace the present flume from Pilarcitos creek to Lake Hondn, hy an iron pipe; to add some twenty miles to ths service pipes in the city, and also to complete other improvements deemed necessary. San Francisco Gas rose to $120, and is now held at $125. Pacific Insurance was sold at $180@$179½ ₱ share. The business of this Company continues profitnhle, owing prohahly to judicious management, and to the nuspicious character of tbe risks taken thus far. Their losses hy the late fire in Virginia City were trifling. Fireman's Fund was dealt in at 123@122 ($12.30 and $12.20 per share), closing at ahout 122 asked. A dividend has been declared, payahle July 2d. California Steam Navigation has heen active, declining from 56 to 49½ ($560 to $495), rallying to 53, and closing at 53 asked.

Crown Point was sold at $1,000@$990, and closes nt ahout the latter figure asked. During the week ending 17th inst., 648 tons of ore were raised. Considernhle first-class ors is being taken from the stope at the hend of middle incline. The new station, lower level, is opened a distance of 30 feet. Receipts of bullion thus far in June exceed those of a like period last montb.

Hale & Norcross advanced to $1,090 and $1,100, and then sold at $1,300. In raising up 100 feet from ths 700 foot level, the ore has improved very much recently, and at 170 feet south of the north line, in stnping from the 7th floor, there is also an improvement, hoth in quality of ore found and in the width of the lods. In drifting east from the 535-foot level, a vein of splendid ore ten feet wide has been disclosed. Some 2,000 tons of ore will he reduced this month, and the yield is likely to exceed $80,000.

Savage declined from $1,050 to $955, rose to $1,000, then sold at $980, closing at $975, s. 30. During the week ending 17th inst., 773 tons of ore were extracted. Tbe superintendent reports a decided improvement in different portions of the mine, with a large increase in the yield and quality of the ore. In sinking from the 6th level the winze continues in excellent ore to a depth of 35 feet, and it is also statsd that recent developments show that a good deal of ore may yet he taken from the latteral deposits on the upper stations. In the Curtis shaft the two southern compartments are almost completed, and good progress is being made in the drift toward tbe ledge.

Gould & Curry rose to $800, and closes at $730 hid. The east drift from ths 2d station now extends some 135 feet, and the south and north branches from the 4th station are in about 40 feet. The ore chambers above still look promising. Receipts of hullion to the 20th instant amounted to $97,000. The Company's mill has been for ten days past running up to only about one-half its full capacity, owing to some repairs to the large engine. Booth's and Bassett's mills will crush some 300 tons this month.

Yellow Jacket rose from $690 to $710, fell to $620, rallied to $635, and sold yesterday at $645@650. There is a large increase in the productiveness of this mine, and for the two weeks ending June 4th and 11th instant, 3,679 tons of ore were sent to different mills, yielding (from partial returns) $109,835. We are also informed thnt the bullion product of the week ending 18th instant exceeded $60,000. These are the most encouraging advices we have had the pleasure to chronicle for a year past from this claim.

Ophir is in less favor, and small sales were made, receding from $347½ to $285, then selling at 295, and closing at ahout $285. From this mine there is nothing new in tbe way of development, the various drifts from the different levels disclosing little or no ore.

Chollar-Potosi has heen dealt in within a range of 205@183, and selling yesterday at 190@188. The Santa Fe Station is said to look rather less favorable, and in cutting through the seam of ore from the Blue Wing, the old works have been broken into without finding ors heyond. In sinking a winze some 40 feet from the 485-foot Potosi level, some low-grade ore has been met with. The 1st station drift (from new shaft) discloses some quartz, and the north and south drifts (from the 2d station) ars in, respectively, 195 and 180 feet. During the week ending 16th instant, 712 tons of ore were sent to custom mills.

Alpha fell from $240 to 207½, and then sold at $206. Belcher fell from $200 to $150, rallied to $160, and closes at $155. Empire Mill and Mining is inactive, hut well held nt $145 per share. We can learn of no new feature in either of these claims.

Imperial fell from 108 to $90, and sold yesterday at $95@103. The receipts of hullion for the first half of this month amounted to $25,000. It is thought that the 7th level drift will soon reach the lode at that depth. Bullion fell from $62½ to $50, and then sold at $55. Overman declined from $29 to $21, rallied to $25, and sold yesterday at $25. Confidence is in a little hetter request, advancing from 26½ per share to $35, and closing at $35. Lady Brynn was dealt in at $3¾@1⅜, closing at $3½. Sierra Nevada sold at $3½@2¾, and Exchequer at $7.

The aggregate sales of Stocks and Legal Tender Notes since Saturday last, amounted to $495,130.

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea,)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,
Principal of the City College.

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLature of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire.....$12,973,949
Marine.....484,408

This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

San Leandro. 19v12-3m

Occidental Homestead ASSOCIATION,

Office, 305 Montgomery street, San Francisco.

Capital Stock : : : : : : $33,600

102 Shares, $33 Each.

This Association was formed to enable its members to obtain desirable homestead lots in this city, at a cheap and easy rate, paying for the same by regular monthly installments. For this purpose they have purchased blocks 499, 500, and 501 in the Western Addition to this city, bounded by Devisadero, Pine, Broderick and Clay streets. Subscribers will pay an initiation fee of $5 on each share taken, to form a fund for defraying current expenses, and $11 per month for thirty months, commencing in April, 1866. The property is within three blocks of the Turk Street Railroad, is nearly all on the grade, and is most desirably located for homestead purposes. It is directly east from the lands of the California Homestead Association. The property has been purchased on very reasonable terms, and offers a rare opportunity for investment. A number of fine houses are in process of erection, and streets are being graded near this property, which will greatly increase its value.

When twelve monthly payments have been made, the property will be divided among the members in the usual manner, and each shareholder will receive a contract for a deed to the lot or lots to which he may be entitled, and have the privilege of taking immediate possession of the same. The lots average 27 feet in front by 120 feet in depth. The whole amount due upon any lot may be paid at any time, and discount at the rate of 1½ per cent. per month will be deducted therefrom. Persons wishing to visit the lands of this Association will take the Turk street cars to Devisadero street, and thence go northerly along Devisadero to Pine street.

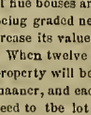
$20,000 of the capital stock is taken, and the books are open for subscription to the balance, at the office of the Secretary, where the Official Map of the Association can be seen, and all particulars obtained.

The Title to this property is perfect.

J. S. LUTY, Secretary.

Office 305 Montgomery street, corner of Pine, Rooms 2 and 6. 20v12-tf

Eyes! Eyes!! Eyes!!!



DR. HENLY, OCULIST AND AURIST, HAS received from Scotland one of the most miraculous remedies for the benefit of the human eye ever before discovered. It is unparalleled in its effects upon the diseases incident to this organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all mucous film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the Eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.

Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and if I do not give them relief in a short time, I will not charge them anything. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco. 22-v12

BACK VOLUMES.

Back files of the Mining and Scientific Press, from January 1st, 1864, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5

Mining Summary.

CALIFORNIA.

Alpine County—

The *Miner* of June 16th has these items: The Morning Star company yesterday struck ore in their drift similar in character to that in the tunnel, and feel confident they are nearing the other chimney for which the drift was started. They will probably put up reduction works soon....Work on the Eastern Slope tunnel is now going on uninterruptedly, and the superintendent says will be continued until that monster ledge is fully proven.

Butte County—

The *Record* of June 16th says: The work of erecting a mill on the Sherman ledge is now in progress, and will be pushed to completion as rapidly as possible. The work is being prosecuted under the superintendence of Mr. Sparks, formerly of the Banner ledge. This ledge is situated some two and a half or three miles from Oroville, on the road to La Porte, and near the line of the Feather River and Ouhir Water company's ditch, which will furnish the working power of the mill.

Calaveras County—

The San Andreas *Register* says: Mr. Irvine is pushing on the work in the El Dorado quartz mine, near El Dorado camp, and taking out a large amount of rock for crushing as soon as he shall have erected his mill. He is now down with the incline shaft about 150 feet. The vein is at that depth over six feet wide, well defined, solid quartz. The rock which he is now taking out prospects well, but it is not as rich as some that has been taken out.... We saw one day last week some of the richest specimens of quartz taken from the Altaville quartz claim, located near the town of that name, than has ever been found in this county.

The *Courier* of June 9th, says: The Buckfield Copper Mining Company have struck a vein of copper six inches wide, producing 20 per cent. ore.

Same paper of 16th inst. has these items: McGlynn's quartz mill, near San Andreas, has been engaged in crushing 500 tons of tailings, which have yielded satisfactorily. The mill will soon commence on quartz from Mr. McGlynn's lead....B. K. Thorn & Co. are developing a promising lead in Rich Gulch, from which they have recently taken some very rich quartz....Austin & Hathaway are the owners of a lead at Jenny Lind about 30 feet in width, which yields from $10 to $40 to the ton. We understand that this claim is about to be sold to parties in San Francisco, for the sum of $75,000....A new quartz lead has recently been discovered near Angels, in this county, the rock from which is said to yield nearly $1,000 to the ton....100 tons of rock from the claim of Dr. Lampher and others, near Mokelumne Hill, yielded $1,500....The Rawhide claim is said to be paying handsomely. The first rock crushed in the new mill yielded $40 to the ton....The Alban ranch mill is again in operation. The rock being crushed is from the Alban Ranch mine....The Willow Creek lead, near San Andreas, is said to be several feet wide, and very rich.

A correspondent of the *Chronicle*, writing from Valleeito, June 3d, says: "A very lively interest seems to be taken here in prospecting quartz, a branch of mining which will, before long, be the main feature, particularly in the southern portion of Calaveras county. Look at Angels; look at Carson Hill; look at Robinson's Ferry; at Vallecito, and many other localities, where quartz has proven rich. All that is now required to demonstrate a certain fact is the employment of a little capital, which will be done sooner or later."

El Dorado County—

A gentleman from Placerville informs us that a new vein of quartz has been struck in the Humboldt lode, near that city, which assays $2,000 per ton. It is not from a pocket either, as several tons of rock, exactly similar in appearance to that assayed, have been taken from the drift, and there is plenty more of the same sort left.—*Exchange.*

Fresno County—

The steamer Fresno on Friday, brought, among other things from Fresno City, 4,500 pounds of copper.

Humboldt County—

The *Times* of June 2d has these items: In the Bear River district two companies are actively operating in sinking wells on their lands, the Fortuna and Oil Creek companies. The former have attained a depth of four hundred feet, and the latter two hundred feet. The prospects in both of these wells are encouraging....In the Lower Mattole district a large proportion of the companies are prosecuting their work with energy. The old or first well of the Union, which is one hundred and fifty feet deep, still yields about half a barrel of oil a day, without any signs of diminution or exhaustion. Well No. 2, one hundred and ninety-six feet deep, affords great encouragement, and well No. 3, on which work is now being prosecuted, is down one hundred and thirty feet, and is already producing considerable oil.

The North Fork company's well is down two hundred and seventy feet, affording the most encouraging prospects, and yielding considerable oil....The Erwin Davis well is now down over eight hundred and twenty-five feet, and now gives off the odor of petroleum, and a strong volume of gas....The Jeffrey well is four hundred and fifty feet deep.

At McNutt's Gulch, the Allen & Sutter company have renewed operations. The earth and rock excavated from the shaft they are now sinking is completely saturated with oil. ....In the upper Mattole Valley, the Mendocino company are about commencing work; the Fonner Farm well is down eighty feet; the Upper Mattole well is three hundred feet deep, and the Yosemite two hundred and forty-seven feet. This last named well will amply pay any one to visit it. The noise made by the gas as it escapes from the well, can be heard yards away.

Nevada County—

From the *Gazette* we clip the following items: We learn that a quartz ledge of astonishing richness was discovered and located last Friday, by W. J. Worley, of Columbia Hill. The ledge is situated on Grizzly Ridge. The vein is about twenty inches in thickness, has been traced for nearly a mile. Many extensions have been taken up. Specimens in the possession of the discoverer, which were broken from the croppings, are literally bespangled with gold; in fact, some of them contain more gold than quartz. Worley and his partners have located sixteen hundred feet, and call their claim the "Big Slide"....We learn that the proprietors of the Banner ledge refused to accede to the demand of the workmen for higher wages, and the work in the mine has been temporarily stopped....The completion of the Willow Valley works was celebrated on the 16th inst. A generous collation was furnished by the proprietors, and all had a good time generally....The mines of Nevada county are attracting much attention abroad. Five or six quartz operators, from Virginia City, arrived in town on Wednesday, and are now examining the mines with the view of locating and erecting machinery....We learn from John Thorp, the discoverer of the Fox copper ledge, that the work upon the original location is progressing as rapidly as the nature of the ground will admit. The shaft is now sunk to a depth of over twenty-five feet and the ore continues to improve....The work on the Hermitage ledge, west of the Fox, has been suspended for the present, but some of the companies are making preparations to resume operations.

Within the past few weeks some of the most extensive mining enterprises ever projected in the State have been inaugurated in this county. For a month or more S. N. Stranham has been engaged in tracing out the great Blue Lead, and has come to the conclusion that the main channel in this county runs under Chalk Bluff ridge. Accordingly, he has made a location extending a distance of nine miles. He is associated with some San Francisco capitalists. The company is known as the "Chalk Bluff Mountain Blue Gravel Company." Another company have made a location of ten miles, under the name of the "Ancient River Channel Blue Gravel Mining Company." The claim is 52,800 feet in length, and 1,056 names were used in making the location. The lead has been traced the entire distance of the two locations. As soon as the necessary arrangements can be made, machinery will be put up at the lower end of the claims, at Chalk Bluff, also at the dividing line between the two claims, and shafts or inclines sunk to the bed rock.

The *National* of the 16th instant says: We were shown a prospect, this morning, taken from four ounces of rock, from the Minnesota ledge, located opposite Snow Point. From four ounces a dollar and a half in pure gold was taken.

The *Union* of same date has these items: We saw some rock yesterday from the Lowery, Stockton lead, taken from a depth of sixty feet below the surface. The claim is located near the Globe Ranch, on the Auburn road. The rock was very rich in gold and sulphurets, the gold largely predominating. The ledge varies from six to sixteen inches in thickness. The owners intend putting up a 5-stamp battery this summer....The Dromedary company have again gone to work in earnest, and are engaged in sinking on the ledge. Yesterday we saw some rock which was taken out on Monday, and which shows large deposits of free gold, besides being very rich in sulphurets.

The *Transcript* says: The Eureka mine at Grass Valley is turning out "cords" of gold. At the last clean-up, after a run of seven days, the company took out $15,000. The run before this gave them $14,800. The Eureka was formerly known as the Emperor's lead....One-half of the German Bar Quartz ledge, situated just above Moore's Flat, has been sold to San Francisco parties for the sum of $20,000.... A nugget of gold, valued at $900, was recently taken out at Moore's Flat....The engine for the hoisting works of the Pennsylvania company was received on Monday, and they expect the boiler up in a few days.

EXCELSIOR.—The *Gazette* of June 19th, says J. B. Jeffrey, Marshal elect of the town of Meadow Lake, arrived at Nevada on Sunday evening. From him we learn that times are quite lively in the new district, and the town is improving rapidly, although lumber and other building materials are high and difficult to be procured. People are rushing into the new district from all quarters, a large proportion coming from the other side of the mountains, and the work of opening and prospecting quartz ledges has commenced. In the streets of the town the snow has entirely disappeared, but outside, it is still lying to a considerable depth, though as might be expected, the late warm weather has been carrying it off rapidly. The owners of ledges have the most implicit confidence in the richness of their claims, and much will be done this Summer toward opening and developing them. Sales of mining claims are frequently made at high rates, and property in the town is rapidly appreciating in value.

The Meadow Lake *Sun* says of the California company's ledges: The California ledge will average 16 feet in width throughout the entire length of 1,700 feet. The Knickerbocker will average about seven feet in width. The Indian Boy is about eight feet wide. The Indian Queen will average about the same. Free gold was found in the croppings in all of them. An assay was made, one from each ledge, in the fall of 1864. The Knickerbocker assayed $157 in gold, and $25 in silver—in all, $182 to the ton. The California went $155, all gold. The Indian Boy assayed $132, all gold. The Indian Queen went $137, all gold. No work, except to comply with the law, has been done upon any except the California and Knickerbocker.

Placer County—

The *Stars and Stripes* of June 13th, has the following: We mentioned a fortnight ago that some very rich float rock had been found on Anthony Flat, near Newcastle, and that parties were looking for the ledge. They found it on Saturday last, and located a number of claims under the name of the "Pepper and Salt Company"—the name being derived from the appearance of the rock. We should think, from what prospects we have seen obtained from small pieces of the rock, that it would pay from $2,000 to $5,000 per ton in free gold. It contains no sulphurets, so far as ascertained. ....We visited the Taylor mine a few days since. This ledge on top is from one to two feet thick, and crops out boldly. The incline which has been sunk from it to a depth of sixty-five feet. The rock shows but little free gold, but "pans out" well, all the way down.

The Dutch Flat *Enquirer* says: E. L. Gaylord, an attorney of this place, exhibited to us a few days since, a specimen from a claim recently discovered about thirteen miles above here, on the line of the Pacific Railroad, which is evidently of exceeding richness in silver, besides showing a handsome sprinkling of free gold.

A letter from Soda Spring Valley, June 10th, to the Placer *Herald*, says: Several parties on prospecting tours, visited Soda Spring Valley within the past few days, from Meadow, Lake Mountain City and Virginia City, pronouncing the prospects far better than at Meadow Lake or the above mentioned mining districts. The most prominent ledges are the Granite, the American, Pittsburg and the Cataract. The Silver Dip and Golden Dip Deerlick ledges, discovered a few days since, are very rich in appearance. Several companies are busy now doing necessary work, prospecting, etc. Several tons of rock is being taken to Summit City or Meadow Lake by parties, intended to be crushed. * * * Soda Spring Valley is located at the head of the North Fork of the American river, six miles south of the Dutch Flat wagon road, ten miles west of Lake Tahoe, and fifteen miles southeasterly from Meadow Lake.

Plumas County—

A Nelson Point correspondent of the Marysville *Appeal*, June 11th, says: River mining is being prepared for. White & Richards intend to flume and work what is known as Deep Hole, under Feather river bridge. It has thirty or forty feet of deep water, and has never been worked, except by the plunge of the boiling flood. It is a whirlpool at times of high water. * * * The Celestials are at work along the river above here like so many beavers. I think there will not be more than two or three white companies try the river this season. All others will be Chinese.

Hydraulic Mining.—The hydraulic mining will soon come to a close for this season, as the water is falling very fast. Some of the boys have commenced to clean up, which will take them about a month.

Shasta County—

The *Courier* of 16th inst., has these items: The Bunker Hill company have struck a good prospect again, but in rock more solid than formerly, so as to necessitate crushing. A pan and a half, crushed in a mortar last week, paid one and a half ounces. They will haul a few tons to the Spring Creek mill to be crushed....Hall & Co.'s new quartz discovery near Hogtown, is receiving considerable attention. Specimens from the lode are showing better and better....Reports from the Potosi are very flattering. Every piece of rock now shows free gold....Kelly is putting up a small mill on the Jollie lode. Will be ready to run in a couple of weeks.

The Sacramento *Bee* of June 18th, says: Captain Robert McCall arrived in town last night on the Red Bluff boat, bringing with him a ton of specimen rocks, taken from a new mining district, recently located about forty miles from Shasta.

The district referred to is Piety Hill. Should the assay warrant it, an English company stands ready to invest. So says the Red Bluff *Independent.*

Sierra County—

The *Messenger* of 16th inst., has the following items: The Pioneer company at Sebastopol have resumed work in their tunnel. This tunnel was commenced in 1854. They have penetrated Bunker Hill a distance of 1,300 feet, and nearly all blasting rock. A few months ago they raised a shaft and found a good prospect, with the rock soft and pitching into the hill....A new ledge has been discovered on Wolf creek, below American Hill, from which some of the richest rock ever found in the State has been taken in large quantities. The matter seems to have been kept quiet lately, but there is no question that the discovery is a valuable one....The Sierra company, at Gold Cañon, are now taking out rich dirt. They have got their tunnel repaired, and are working on the old course and taking out about $2,000 per week with twenty-five men. ....Rice & Wright having purchased the mining grounds of the Fremont, Morning Star, Know Nothing, Ohio and Nary Red companies, have commenced work at the old incline of the Fremont at Wet Ravine, and getting along finely with a prospect of getting into pay about August or September.

Siskiyou County—

In this county Lash & Co. have discovered a very rich lead of gold-bearing quartz on the north fork of Humbug. Gold, says the *Journal*, can be seen in most of the rock, which will average $600 to the ton in gold, and about $30 in silver, without the least particle of lead.

Trinity County—

The *Journal* says: Trinity Center presents a rather lively appearance at present. Mining operations are fairly under way, with a certain prospect of plenty of water the entire season. If San Francisco capitalists would build the proposed ditch from Coffee creek, that would be one of the most flourishing mining sections in the county, as it already is in an agricultural point of view....The flume of Selander & Anderson, on Fillibuster Flat, was robbed of about $600 on Friday night of last week. Several sacks of the dirt cleaned from the flume were found by Mr. Anderson in an old tunnel at the head of the Flat, from which about $110 was washed.

Tulare County—

The *Times* of June 15th, says: From a gentleman just returned from Havilah, we learn that the mining interests throughout the Clear Creek region never looked more promising. New discoveries are being made—one about twelve miles southeast of Walker's Basin, being considered of great value. The Joe Walker lode, in the Basin, is proving immensely rich. The company have a shaft down about eighty feet, and is extremely favorable in appearances. It is pronounced by some of the parties to be equal to the "Long Tom."....We learn that the new and valuable quartz mill belonging to Mr. James, Carter, on White river, near the town of the same name, is completed, or nearly so, and will commence running in a few days. There is some three hundred tons of rock out and ready for the mill as soon as it is started.

Tuolumne County—

From the *Courier* of 16th inst., we clip these items: Last week the Mount Vernon company in Sugar Pine, commenced crushing their rock at the Monitor mill, which they have leased. Twelve tons were worked as a test, and yielded about $108 per ton....During the past week another golden stream has flowed from Bald Mountain. Some miners took out about fifty pounds of gold from a claim that had been given up in disgust, some years ago. There is no hill in the State that has yielded so much treasure, though comparatively little work has been done on it.

Yuba County—

The Marysville *Appeal* says: One hundred and twenty-five shares of Dan. Webster stock, Brown's Valley, sold at $2.50 per share. There are very few sellers, and from $5 to $10 per share is now asked....Twenty-five shares in Templar No. 2, Indiana Ranch, changed hands yesterday at $5 per share....An assay of sulphurets, from Templar No. 2 rock, was made yesterday by Knight & Co., assayers, with the

following results: "We hereby certify that the samples of sulphurets assayed by us for you this day (June 16th) contained oz. 67.06 gold. $1,386.13 to the tan af 2,000 pounds. No silver or other metals."....Tho new boilers for the Jefferson mill, of Brown's Valley, weigh 12,000 paunds.

NEVADA.

Washoe—

The Gold Hill *News* of 10th inst., says: As we predicted last week, in our notice of the Yellow Jacket, it has gone on, increasing the supply af pay rock brought to the surface, till the quantity averages 300 tons daily, and employment in consequencec is given to 12 mills. ....Gold Hill mines are giving out—morc bullion than all the bulance of the mining districts in the State summed together.

Como, once a prosperaus town, is now almost entirely deserted, there being hut une house occupied, the National Hotel, a costly structure, which now shelters a few woodchoppers, who pay ten dollars per month rent.

The Gould & Curry mill crushed, for the month of May, 3,700 tons of rock, which worked within 11 per cent. of assay.

The *Enterprise* gathers the following items from the Surveyor of Churchill county: The Silver Wave company, in La Plata district, are running a tunnel which they expect to be completed by tho first of July, striking their ledge ut the depth of nearly 300 feet....The Satellite company huve completed their tunnel and have developed a very luir lonking ledge. There are also two New York companies owning and developing mines in the district, with excellent prospects. There are two fine quartz mills in the district, but they are not running at present....In Clan Alpine district there are muny very fine ledges, hut the only one tharoughly developed is the McGregor, a good sized ledge, into which an incline has been sunk 180 feet deep. The mill is now on good pay rock....In Silver Hill District there are some very good looking ledges, but they do not appear to be much worked at present, there being but few people thereabout. The United States Series are the only ledges being worked.

Reese River.—

The *Reveille* says: "At the present time one cannot contemplate the future of Austin and the mining interests of Reese River hut with the brightest anticipations. Never has prospecting been carried on so vigorously nor with greater success. The discaveries of surprisingly rich ledges and in great numbers in distant districts, und the developments in our own neighborhood, surpass unything of the kind in their grand promise of wealth that have ever been recorded."

From the samc we clip the following itcms: The Philadelphia district, a newly organized one, is attracting great attention. The ledges already located are the Transylvania, Nos. 1, 2 and 3. These locations show out-croppings lor more than three hundred yards of a well-defined ledge of from four to fifteen feet in width, the mineral of which by actual assay has given from $200 to $2,000 per ton. In every place where the ledge has been broken in upon, a similar quality of ore was found. These mines are eighty-five miles southeast from Austin. ....Next day's issue of same paper says the excitement was increasing....While at the assay office of Boalt & Stetefeldt to-day, we were shown a beautiful button of almost chemically pure silver, three-quarters of an inch in diameter, yielded by one ounce of ore, obtained from a vein in the viciaity of Yankee Blade. The yield was nt the rate of $11,857.37 of silver per ton....The Keystone mill was put in motion yesterday after beiag closed for several weeks....Col. David E. Buel, proprietor of the Eureka mill at Big Creek, is having it dismantled for immediate removal to the Philadelphia district, where he owns large interests in several apparently rich veins....Eighteen assays of the first and second-class ores obtained from seven differeat ledges, in White Pine district, gave un average yield of $33 of silver per ton. The best yield was obtaiaed from ore of the Mohawk ledge....The excitement of the week appears to he in the rich strike recently made in the Autocrat, ia Ophir Canyon, Twiu River District. An assay of this ore was made by Thomas Cahill of this place, and gave the handsome result of $274.87.

The Nye county *News* has these items: The Knickerhocker mill is nearly ready for operatiou....We understand that the Pleaides boys have out a large pile of fine ore, as also the Franklin, Brown, Robert Burns, Storm King, Mountain Brow, Indianapolis, Victor and others. We were shown some splendid ore from the Victor, whieh elaim recently "struek it rieh," and are now taking aut as fine ore as can be found in the distriet....The mill in San Aatoaio distriet is soon to be started again.

Esmeralda—

The *Union* of June 9th, says: We have been informed that 2,200 pounds of rock from the Crockett mine have been worked by a gentleman from San Francisco, and yielded over $800 per ton. He also tried 400 pounds of the rock which they are throwing away, and got a return af $80 per ton....The hoarse bellowing of the steum whistle af the great Del Monte mill greets our ears regularly now three times u day, and its roaring is sweeter to the ears of aur miners than the most exquisite music. We are informed that the oro crushed ut this mill last week yielded very handsomely. Two other mills are kept running almost constantly, crushing custom rock in small parcels, the yield generally being satisfactory.

Fifty or one hundred men could find employment ut $4 per day in this and the adjoining districts....Work in the shaft of the Philadelphia company is progressing with commendable alacrity.

Humboldt—

The *Register* of 9th inst. has these items: The Seminole tunnel is now in 150 feet; running in softer rock, now, and still improving—making two feet u day, and prospects that the rock will soon be found to yield without blasting....The Pioneer mill is kept running night and day. Superintendent Fall is doing everything possible to keep tho mill supplied with outside rock, while opening the company's ledges....The American Basin company has its tunnel now in to a distance of over 600 feet. It is working three shifts of men, now, and is running through scattered quartz and small seams of oro almost every day. Negus, superintendent, is on the lookout for the ledge right at hand.

Pahranagat.—

The *Reveille* gives notes furnished by Gov. Blasdel's party:

Although the district has been discovered upwards of two years, there is hut a solitary instance where an excavatiou has been made in a reul or supposed ledge eighteen iaches below the surface. There are several remarkable locations, autcropping boldly for the length ol a hundred feet, which development may determine to he true ledges. These ledges are estimated by their outcropping to be from five to twenty feet thick, and muny of them exhibit fine mineral. A singular vein, characterized as a mother vein, jutting above the surface bold and grand like a tower, is estimated to be fifteen or twenty feet thick, and apparently capahle of yielding an abundant supply of a low grade of ore. It throws off at regular intervals a number of lateral spurs, varying from five to three feet in thickness, all containing seemingly upon the surface mineral of the richest character. It is douhtful whether they are spurs or transverse veins, as their mineral is entirely different from that of the mother vein; and no development has yet been undertaken to remove the doubt....By the new route the mines are only 150 miles from San Antonio. The latter place is forty-five miles from Austin....We learn from Henry Schaefer, who has just arrived from Pahranagat, via Egan Cañon, that considerable activity prevails in the district. Mr. Schaefer left there five days after the departure of Governor Blaisdel and party. The two smelting furnaces were eompletely finished and ready for use. They are situated at a point in the mines known as Logan's Springs. Captain Dahlgren is also constructing u large furnace at the same point. According to Mr. Schaefer, there are six to eight companies engaged there, which are employing from 100 to 150 men, working upon mines, smelting works, and as teamsters. Mr. Schaefer predicts that Pahranagat will ere long be generally regarded as a valuable acquisition to the already large silver domain of Nevada....From Pahranagat to Callville, the head of Navigation on the Colorado river, it is 175 miles. A wagon road would be 200 miles.

The Tulare *Times* of June 15th, says: Mr. Thomas McFarlane, who returned a few days since from the Pahranagat mining district, estimates the distance, from Kern river to the mines, as the road will run, at 330 miles. For the greater portion of the distance grass and water are abundant and good, and no serious obstacles to be overcome. There is a good natural road nearly the whole way. From Pahranagat to Salt Lake City—450 miles—there is an opened and traveled road.

IDAHO.

The *Avalanche* of June 2d, has these items; The Oro Fiao is working about seventy men. The superintendent showed us around the mine the other day. They are taking out and sacking the richest average lot of ore we ever beheld. Every piece is covered aad filled throughout with free gold. Expect to soon have a crushing of thirty tons of are, which we truly believe will yield near $3,000 to the ton. The mine steadily supplies three mills with rock....The Surplus Oro Fino is taking out rich are night and day. There is fully three hundred tons of sorted ore at the dump. The shaft is down eighty feet, hut the drifts are being run at thirty-five feet. Water is troublesome. Preparations are beiug made to erect a platform and *chute*....The Cosmos discovery shaft is dowa one huadred aad forty-five feet and on the extension eighty feet. The ledge will average five feet wide to the present depth. The company has near 600 tons of pay rock ready to mill....The Lincola compaay have taken advantage af the plentiful supply of water in their ditch and, at a very small expense, ground sluiced aff their tailing-yard to the bed rock....The shaft on the Minnesota ledge has been straightened and timbered up in the most substantial style....Messrs. Reuter and Johnson discavered a ledge on the 23d ult., which they christened the Saxony. It lies about four hundred feet east of and parallel with the Silver Legion. The discoverers are working on it and on Wednesday it showed two feet of solid quartz, with several small seams....Jack Wheeler and H. Sweeny, of Flint district, started for Denver, Colorado, yesterday morning. Their object is to purchase one of the many idle mills in that Territory, bring it overland and set it up in Flint the present year....Messrs. More & Fogus cleaned up, last Saturday, $17,000 in bullion. ....The party which went to prospect the Red Mountain region have returned. Are favorably impressed with the country. Faund mountains of quartz containing mineral, alsa large tracts of country containing plucer gold.

Correspondent of same paper at Oro, Flint district, May 29th, says there are twenty or more ledges in that new district that are each capable of keeping u hundred stamps supplied with good paying rock. The *Avalanche* of May 26th, (which we failed to receive—EDS. PRESS) says of these mines: These ledges all show from three to seven feet of solid quartz and a number of them solid casings. The rock is full of streaks and spots of black sulphurets of silver—the native metal being visible in some. Ten tons of average rock taken fram within ten feet of the surface, and imperfectly worked, gave per toa a fraction over $171. Ore of most other ledges looks equally well, and the many small bricks obtuiaed by hand process, places it beyond douht.

Coal has been found withiu eight miles of Ruby City, Idaho.

The *Alta's* correspondent at Boise City, June 1st, says of the South Boise mines: The owners of the lead Robert Burns have struck the vein, and fiad it over twelve feet thick, and the rock prospecting as richly as the famed Atlanta. The latter lode is reported at from twelve to sixty feet wide; hut fram observation I think sixteen feet about the averoge thickness. * * * On Red Warrior creek, one und u half miles southwest from Rocky Bar, the Red Warrior aud Bear Creek Tunnel Company, of which Rasey Biven, Esq., is chief executive, have run 350 feet inta the mountain, cutting through various small strata of quartz, in all of which they found gold.

Four hundred Chinnman have come into Idaho City, during the spring.

A letter to the Mariposa *Gazette* from an acquaintance ia Idaho City, says: "The mining season here has opened finely. The White Brothers made a clean up of $26,273 in eight days, with thirty-eight hands and 400 inches of water. They have taken out over $60,000 already, aod will probably take out $100,000 more this season. Moore & Co. have done well, and Moore has sold the Owyhee property conditionally to an English company for $1,550,000, the mine to be paid for if the agent of the company reports favorably upon seeing it. Sam. Kelly and Green White have sold 800 feet of the eastern extension of the *Illinois* to a New York compauy for $40,000, ta be paid for in the fall. Elevea tons crushed from the vein yielded $562."

MONTANA.

The *Post* of June 2d has these items: In Wisconsin Gulch a party of four men took out 116 ounces in one week....The hydraulic claims are paying largely, as far as they have yet gone. After this week we shall be able to give a more detailed statement of them. There are sixteen claims at work and in preparation for washing. Blake's claim yielded $1,260 to four days run on old drifted ground. The Missouri Company, in four days run never touched bed-rock, but cleaned up $700, hunkable dust....The foundation for the Foster mill, on the Mesler lode, is down to the bedrock, and the timbers are all out. The lode is opened both ways from the discovery, and looks spleadid. It is six feet wide on the average, and as rieh in free gold as anything yet struck up there. In sixty days, we hope to hear the whistle of the splendid mill aow, we believe, at Benton....Deep Creek is immensely rieh. A couple of young men, with a rocker, took out ninety-six ounees in a week....The aceounts from Bear Gulch are eonflieting, up to date; the pay seems to he chiefly helow the mouth of Deep Creek....A little dry gulch, rejoiciag in the name of "Bilk," is very rieh; they are melting snow and taking out a great deal of money with rockers.

Correspondence of same from Bannack, says: The Baanack Ditch Company have every prospect of doiug well, whea they get fairly to work. Last week, on Nuggot Hill, they took out twelve dollurs and upwards to the haad, and their ground was improviag. We expect larger results from other placers whieh they are prepariug to work.....Some of the gentlemen belonging to the McLean Silver Mining Company have arr.ved. Wark is progressing finely on the Eaton lode, and the recent developments ure of the most substantial kind....Mr. Esler's discovery—the Legal Tender—is unsurpassed by anything in the Territory; the mean of assays performed by different scientific individuals varying fram $507.87 to $865.42 per ton. Tho company have alsa 8.291 leet of gold lodes in Bald Mountain district. Smelting furnaces will be erected an the Legal Tender mine, in early spriag....The steamboat St. Johns, forty-eight days from St. Louis ta Fort Benton, passed sixteen hours, and reports thirty steamers, with an average of from twenty-five to thirty passengers on their way.

A letter from Blackfoot ta the Hombaldt *Register*, says that at present there ure twenty to ane morc mea there than needed.

The *Flag* gives an extract fram n privnte letter dated Ruby City, May 27th. We quote:

Montana may be a good placa for some, but it is a cold inhospitable region, aad in my opinion, from all I can learn (and I have good chances to knaw), it is not generally rich, but spotted, bully overrun, and all the good claims are monopolized. I have seen men every few days from there, lor the past year. They generally condemn it, as not hulf as good as California is now.

COLORADO.

From the *Journal* of May 29th, we clip the following: Col. Tannatt has cammenced preparations lor a Keith furnace in the Manhattan mill. His batteries have been taken down and removed, also his Dodge pans aad Eatoa amalgamntars. Excavations are beiug mnde inside the ald mill for a Keith furnace 18 by 11, and more than 25 feet high, with upright stack fifty-six feet in hight. He has an Ingersoll Crusher on the way, which he intends to use instead of the Blake machine used by Keith. The new mill contains room far twelve shaking tables....Mr. DuBois has purchased the large new boiler of the Kip & Buel compaay, aad will immediately move it down. He hopes to be ready to run in six or eight weeks....Mr. Ford has put up a pair of collum separators, aad is preparing to huild a regular reverberatary smeltiag furnace....Samuel P. Lathrop & Co., owning the extensioa west of the Harsh, which they call Star, are beginuing to open it in the expectation of selling the ore to the custom smelting works and Keith Furnnces....The Downieville Mining eompany, in Clear Creek county, has recently started up. It has a 12-stamp mill, run by water-power. .....The Brastow Gold Miaing company's claim, on the Bobtail lode, is turaing out some very rich ore, as also the claim of Mr. Sensenderfer....The Periga compnny are endeavoring to raise capital wherewith ta resume work on their mines....We predict that before the summer is half gone there will be more doiag in mining thaa before since 1863....There is now quite a movement toward the country in which head Bear, White, and Uiatah rivers, among old prospectors. A compaay was in there last fall aad found such encouraging prospects as to iaduce it to go back prepared to mine. It went from Empire on Saturday. Seveateen aien started from Eureka Gulch yesterday. Others are preparing to go.

UTAH.

The Salt Lake *Vedette* of June 7th, has the following in regard to the Rush Valley silver mines: The miners—the more energetic among them and those who cna command the requisite means—are husily engaged ia opeaing their leads, or, in erecting works ta reduce the ores. The Argenti company has suspended operations temporarily, on account of a change in directors. * * * The Monheim company has a furnace completed except liniug with fire-proof material. It will soon be in readiness for smelting. Mr. Finnerty, whose miae we examined, has a fine tunnel run in on his veiu about one hundred feet, the depth from the surface at that point being ia the vicinity of seventy feet. He has a lode over six feet in width, from which he is taking out ore at the rate of five tons per day. He is erecting a furnace on the famous Lyons model, of Colorado, whither Mr. Finnerty went last winter to learn the process. His average ores yield over two hundred dollars per toa.

BRITISH COLUMBIA.

A letter from White Bluffs to the Dalles *Mountaineer*, dated June 3d, says: A train of 143 aaimals, belonging to the Hudson Bay company, arrived here on last Thursday, nine days from Colville. They report great excitement at Colville, on account of the Big Bend mines; that the town had almost been deserted aad finding it too early to work in the mines yet, one hundred had returned. The miners seem encouraged, although there is from three to four feet of snow around the Big Bend, which is disappearing rapidly.

White Bluffs is on the east haak of the Columhia, fifty miles abave Wallula.

Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

San Francisco:

Saturday Morning, June 23, 1866.

THE SAN FRANCISCO BOOT NAILING MACHINE

We alluded at considerable length, some weeks since to a boot and shoe nailing machine, recently invented by Mr. E. T. Barlow, of this city. This machine has since been set up, and may now be seen in operation daily, at the southwest corner of Stockton and O'Farrell streets, where the public are invited to call and examine it. This is one of the most ingenious pieces of mechanism we have ever met with. The machine displays more mechanical ingenuity than was evinced even in the original sewing machine. Many efforts have been made to accomplish the object attained by this machine, both in this country and Europe, but we believe this is the only attempt which can be pronounced anything like a success. No one who will look upon the operation of this machine for a few minutes can entertain a particle of doubt as to the complete, practical success of the machine.

By an ingenious arrangement of cams, levers, springs and cutters, it is made to take a coil of wire, and by merely turning a crank with one hand and guiding the boot or shoe with the other, the nails for holding the sole are made and driven to their place at one operation, more rapidly than the most skillful hand can drive them in the present way, after the holes had nails are made. The nails are notched or barbed as they are made, and firmly clinched on the under side, and headed upon the upper, so as to render it almost impossible to remove the sole until the nails are fairly worn out. The rapidity with which it works is wonderful, and the construction of the machine such as to remove all reasonable danger of disarrangement or breakage of any of its parts. It performs its work with the greatest uniformity and steadiness, and may be adjusted to work upon any required angle. It is applicable to wood work as well as to leather; and will be found very useful for putting together small boxes, such as caddle or tobacco boxes, and the like. The machine is a San Francisco invention, and as such reflects the highest credit upon the skill of our California mechanics. We trust that arrangements will be made at an early day to manufacture it for general use. It need not be costly; but can be manufactured at a price which will place it within the reach of every manufactory of a size sufficient to call for any class of machine work. It is also to be hoped that the inventor will take measures to secure for it a place in the Exhibition at Paris, where, we are persuaded, it will attract marked attention, and be set down as one of the most useful and ingenious machines of the day.

A COMPLIMENT TO CALIFORNIA MECHANICS.

We understand that a gentleman who owns a fine private residence on Staten Island, near New York, has become so well pleased with the working qualities and appearance of Hooker's Excelsior Pump and James B. Johnson's Windmill, both California inventions, that he has ordered one of each to be built in this city and shipped to his residence on Staten Island. The party referred to is a gentleman of much intelligence, and has given the order as above for the sole reason that, in his judgment, there is neither a windmill or pump, of Eastern manufacture, that will compare with the ones he has ordered. San Francisco machinery ordered to New York is an item worth mentioning.

THE SODIUM PROCESS—WHO WAS ITS INVENTOR?

Quite a lively discussion has been going on of late, in several publications, both English and American, with regard to the identity of the original discoverer of the sodium-amalgamation process for saving the precious metals. Priority of discovery has been claimed for both Professor Henry Wurtz, of New York, and the eminent chemist, Mr. Wm. Crookes, of London, by the friends of the respective parties. In our issue of the 19th of April last, we gave Prof. Wurtz's version of the matter, wherein that gentleman claimed that although his patent is dated as late as December 12th, 1864, the discovery was actually made several years before, and communicated "both orally and written, from time to time, to many persons"—Professor Silliman among others.

It also appears that on the 28th of April of the present year, a friend of Professor Wurtz, in a communication to the London *Mining Journal*, cites dates, and points to them as showing quite conclusively that Prof. Wurtz, and not Mr. Crookes, must have been the inventor or discoverer, and calls upon the latter to give an explanation of the circumstance upon which his claim rests.

In answer to this call, Mr. E. P. H. Vaughn, of London, who acted as agent for Mr. Crookes in obtaining his patent, makes a reply from which we extract the following paragraph:

I will also refer to dates, and may observe that I believe Mr. Crookes was, previously to July, 1865, altogether ignorant of the existence of such a person as Dr. Wurtz, of New York. For upwards of six years prior to 1865 Mr. Crookes had been engaged in experiments, having for their object the employment of metallic sodium in amalgamation; and, having sufficiently matured his process, he applied for a patent on February 11 in that year. In the course of the month of July, 1865, I was informed that the application which I had made for the American patent had been rejected, on the ground that Dr. Wurtz had already patented an invention which was substantially identical with that of Mr. Crookes; and it then appeared that Dr. Wurtz had filed his application in November, 1864, and that his patent was allowed on December 27, but was not issued until the following June, when the specification became public. I should here also observe that the writer of the article in the *Journal*, in his anxiety to be exact, has given the date of Wurtz's process as December 27, 1864, and that of Crookes' process as August 12, 1865. The date which he gives as August 12, should have been August 11, and is the date of Mr. Crookes' *final* specification, which was an amplification only of his *provisional* specification filed on February 11, 1865, and long before anything of Dr. Wurtz's American patent was known in this country.

With regard to the insinuation of plagiarism, it is sufficient to say that Mr. Crookes can produce ample evidence, both documentary and oral, to show that in 1861 he gave a full written description of the sodium process, drawing attention to its value in amalgamating gold ores, to an American gentleman, for the express object of transmission to New York. However, the disorganization of trade, consequent on the outbreak of the American war, prevented the publication at the time of his discovery in the United States. It is, therefore, clearly impossible that Mr. Crookes should have appropriated the alleged invention of Dr. Wurtz, of which he had never heard, and the particulars of which he could not possibly have known.

It may not be unimportant to mention that Dr. Wurtz applied for an English patent in June last, which was successfully opposed by Mr. Crookes in the following October, when the Attorney-General allowed the patent to pass, upon the ground that all which related to the use of sodium for gold and silver amalgamation should be struck out of the specification. The value of what remained of the patent applicable to the treatment of the other precious metals I leave for those acquainted with the subject to estimate. It is not my desire, however, in the least degree to detract from such merit as may appertain to Dr. Wurtz as an independent investigator, if the facts will support him in that character. The history of discovery abounds with analogous cases; but I cannot refrain, in the interests of science, from deprecating the indulgence in insinuations and innendoes, such as are evidently intended to be conveyed by the article which has called forth this communication.

TWELVE thousand children were born in this State during the past year.

THE FRENCH EXHIBITION OF 1867.

Some months ago Mr. Banks, of Massachusetts, introduced a bill into the National House of Representatives, appropriating a certain amount to aid the proper representation of American art and industry in the approaching World's Exhibition at Paris. This bill was promptly passed in the House. The telegraph informs us that the Senate, on Friday of last week, took up the bill, and passed it after a long debate, amended so as to increase the aggregate of appropriations to $156,000, in addition to a special item of $25,000 for the erection of extra buildings.

The bill as introduced by Mr. Banks, and as now passed by the Senate, contemplates the appointment of ten Commissioners, by the President, to represent the ten grand divisions of human industry into which all the pursuits and products of man are classed. Each Commissioner is to represent the especial interest to which he is referred. The divisions are as follows:

1. Works of Art.
2. Materials and appliances of labor to Art.
3. Furniture and other household articles.
4. Clothing, including clothes and wearing apparel.
5. Mining, and the rough and wrought products of mining.
6. Processes of mechanic arts.
7. Food, fresh and preserved, in its various states.
8. Leading agricultural products and specimens.
9. Natural horticultural products and specimens.
10. Objects especially exhibited for improving the physical and moral condition of the population of the earth.

These ten grand divisions are subdivided into ninety-five classes. It is of vast importance to commerce that the results of this exhibition should be carefully noted and properly placed before the people of this country in such a manner that they may be fully able to comprehend their advantages, and fitly appropriate them for the common benefit. No better method could have been devised to accomplish such an end than the one proposed. We have eminent and practical men in all the departments of industry specified, who are fully capable of making the necessary comparative observations, and of illustrating our own relation to the industrial pursuits of the world as they now stand, and pointing out the advantages that may be derived by modifying or improving our own practice wherever it may be deemed desirable, after the grand comparison of efforts that will be made the coming year at Paris.

The salary of each Commissioner has been fixed at $1,000; a sum happily so small that it will not be likely to attract the spoilsman. The appointment is purely honorary, and will not be likely to be sought after except by persons who will fully appreciate the duties expected of them, and who will be likely to confer the greatest benefit on the industry of our common country.

Some idea of the interest which this exhibition is attracting throughout the world, may be inferred from the following comparative statement between this and the Paris exhibition of 1855. The number of proposing exhibitors, exclusive of fine arts, is 2,280; in 1855 the number was 1,541. The total net space demanded in the forthcoming exhibition exceeds 305,000 square feet, exclusive of space demanded in the park. The net space at the disposal of the British executive is 93,000 square feet, or considerably less than one-third of the space asked for. In 1855 the net space filled was 65,000 square feet.

HENDY'S IMPROVED CONCENTRATORS.—Another of these machines has been ordered for the mines of Placer county, by C. H. Schuable. Mr. R. P. Johnson, of Jamestown, Tuolumne county, states in a letter shown us this week, that he considers this concentrator a most valuable improvement. In another column of the paper a reward is offered, by Mr. Hendy to any man who will produce evidence of a failure of any one of his concentrators.

NEW POWDER MILL MACHINERY.

The proprietors of the Miners' Foundry have been engaged for some time past in the construction of a lot of heavy machinery for the "Santa Cruz Powder Works," situated about two miles above Santa Cruz, on the San Lorenzo river. This machinery is now being shipped to its place of destination, and consists of a steam engine of 16 inches diameter of cylinder and 36-inch stroke, rating at about 100-horse power; two pairs of edge rolls or wheels, running in massive cast iron pans, and weighing seven tons each; also eight charcoal retorts, arranged in two benches of four each, most admirably designed for economizing fuel; and four large grinding mills.

A steam engine, with boilers, is something of a novelty to be connected with a powder mill; but yet such is the arrangement at these works. The boilers are to be set at a distance of about 1,000 feet from the main works, and upon the opposite side of the beautiful San Lorenzo river, which runs through the ground belonging to the company. The steam is conveyed to the engine by a pipe carefully protected from radiation, so that very little steam will be lost, while the requisite degree of safety will be obtained. The connection of the massive rollers with the driving power is admirably arranged, so that the shafting and gearing is placed beneath the floor, and quite out of sight from the mixing room, so that in case of explosion, there will be nothing but a small quantity of light covering to the room to be displaced; thus avoiding as much as possible the loss to both life and property in case of accident.

The grinding mills consist of a series of barrels, constructed and operated very much after the manner of the ordinary Freiberg barrel, employed in working silver ores. The charcoal, which is made of willow, in close retorts, together with the sulphur, is placed in these barrels, in connection with a large number of small iron balls about an inch in diameter, and the barrels made to revolve slowly. The action of these small balls of iron, soon reduces the coal and sulphur to an exceedingly fine powder, in which state it is conveyed to the mixing pans, where, in connection with the niter, it is ground, in a plastic condition, under the enormous pressure of the seven ton wheels already described.

The capacity of this machinery is fully equal to that already in use by the company, and which will still continue to be operated in order to supply the heavy demands for powder, for blasting and other purposes.

NEW MINING MACHINERY.—The Miners' Foundry is at present engaged in turning out large quantities of mining machinery. The proprietors are now at work upon a set of hoisting works for the new shaft of the Empire and Imperial Company, at Gold Hill, Nevada. This machinery is intended for deep sinking, and has been especially designed for that purpose. Attached to the reels, which are two in number, working with a single rope, through a double shaft, and directly in front of the person in attendance, are arranged two dial plates, which mark distinctly the exact position of either bucket in its appropriate shaft, at any point in its ascent or descent. These dials, we believe, are the first ones which have ever been put up in connection with any mine on this coast, although they are common in European mines.

This foundry is also constructing a 20-stamp mill, for working blue cement gravel, and a 10-stamp mill, with hoisting works and pump for the Andrew Jackson Company, at Smartsville, Yuba county. The latter mill will be driven by three 8-foot tangental water wheels. A 10-stamp mill has just been shipped for the Occidental Company, at Jacksonville, Oregon. Two of Hungerford's Concentrators (elsewhere illustrated in this paper), accompany this mill.

There is a house in Pembroke, Massachusetts, which is 230 years old. It is still inhabited, has always been in one family, and is believed to be the oldest house in the United States.

The San Francisco Latin School was established in June, 1865. Those who graduate from it will be fitted to enter colleges of the highest standing, as the course is a full preparatory, classical one. It comprises Latin and Greek, Arithmetic, Algebra, Geometry, Geography, History, Declamation, English Grammar, Rhetoric and French. The Mathematics are pursued to that extent that will qualify pupils for college.

Those who intend to have their sons follow a profession, will find that the course pursued in this school will prepare them to enter upon their professional studies, if they should not desire to send them to college.

Candidates are received for admission to this school, from both public and private schools.

No candiduto under ten years of age will be admitted. Each applicant must be ablo to read English fluently. He must be well versed in Mental Arithmetic, and in Colburn's Common School Arithmetic to pago 144, or its equivalent, be ablc to answer the most important questions in Geography, and must have sufficient knowledge of English Grammar to parse common sentences in proso, or an equivalent knowledge of Latin Grammar.

The first graduating class will completo its course on the first of June next. The usual course of study will be threo years, which, however, will be incrensed to four years for younger pupils. A full course in the Boston Latin School comprises six years; but the boys of San Francisco are expected to do a little better than the Boston boys.

This school is under the management of Mr. George M. Bunnell, as Principal, and Mr. W. K. Rowell as Assistant. During the past term of five months it has numbered sixty-three pupils. Of this number, fourteen have attained the first grade on the Roll of Honor, and four the second grade.

Mines and Mining Matters in Congress. The telegraph of June 16th states that Senator Conness, from the Committee on Mines and Mining, has reported a substitute for Mr. Sherman's bill to regulate the occupation of mineral lands, and to extend the right of pre-emption thereto, of which substitute the Committee say in their report: "By this bill it is only promised to dispose of the mines, and to provide for the segregation of agricultural lands lying within mineral regions. The proposition is to transfer the title to possessors at reasonable rates, and as part of that rate to secure the payment at three per cent. of the annual net proceeds into the United States Treasury, until the National debt shall have been paid; and this percentage is to be in lieu of all tax imposed upon the bullion at the mints and assay offices under existing laws. It is not proposed to interfere with or impose any tax on miners engaged in working placer mines, as these mines are readily exhausted and not generally remunerative; and another feature of the substitute is that it admits of rules and regulations of the miners, where the same are not in conflict with the laws of the United States."

Mr. Julian, from the House Committo on Public Lands, has submitted an elaborate report on the sale of mineral lands, to accompany the amended bill recently reported by him in the House. The report argues that the policy of preservation has proved a most signal failure, and illustrates by quoting from a late report of the Nevada Senate, showing the utter want of uniformity and the confusion worse confounded which prevails, growing out of the uncertainty of titles. The report advocates vesting the fee in miners to the extent of forty acres to each person, and the bill reported expressly authorizes departures from the rectangular system of survey when necessary, and the adoption of boundaries agreed upon by mining occupants.

A. D. Brown, of Virginia City, sends us samples of Kaoline, native and manufactured from an extensive deposit of that material, which has recently been found near that place. We shall endeavor to make further notice of this discovery, and answer our correspondent's queries next week.

Mr. Geo. H. Strono, late from the Scientific American Patent Agency, New York, has associated himself with this office, and will pay special attention to the patent department of the Press, and executing drawings for specifications and engraving on wood. Our patrons will not be disappointed with his efforts to servo their interests.

Fortunate Mining Purchase.—The Marysville *Appeal* says that the San Francisco parties, who recently purchased a quartz ledge in Wood's Ravine, near Nevada City, for $11,000, proceeded immediately to crush a lot of rock, which had been taken out previous to the purchase, and realized therefrom $13,000.

Santa Clara College.—The annual exhibition and commencement exercises of Santa Clara College will take place on the 26th and 27th instants. We acknowledge the reception of an invitation to be present, and shall endeavor to have the Press represented there on that occasion.

TOWNE & BACON, Print—

THE SAN FRANCISCO
BOOT AND SHOE NAILING MACHINE.

THIS MACHINE MAY NOW BE SEEN IN DAILY OPERation at the corner of Stockton and O'Farrell streets, where the inventor may be seen and consulted at all hours.

He is especially anxious that Boot and Shoemakers, Mechanics generally, and all persons interested in the success of California inventions and California manufactures, should call and examine this specimen of California ingenuity.

The proprietor is making arrangements for their manufacture in this city; and he is now ready to contract to furnish the machine to such parties as may be desirous to purchase the same.
E. T. BARLOW.
San Francisco, June 22d, 1866. 25v12

$100 Reward!

THE ABOVE REWARD WILL BE PAID TO ANY ONE who will produce evidence of a failure of any of
Heady's Improved Self-Discharging Concentrators,
Patented February 27th, and April 17th, 1866—which said amount is deposited for 60 days with Palmer, Knox & Co., No. 19 First street, San Francisco. Send for a circular containing a description of the machine.

Rheumatism!!
READ IT! READ IT!!

Sacramento, April 16th, 1866.

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITing I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial.
Yours truly, GEORGE TAYLOR.

☞ Richards' Remedy is for sale by
H. BOWMAN,
Druggist, Sacramento.
Price, $2 50 per Bottle. 20v12

Subscribers who do not receive the Mining and Scientific Press in due time, are requested to inform the publishers.

ONLY A LITTLE BROOK.—A simple but touching incident has been related to us, says the *Maine Press*, in connection with the last moments of a beautiful little girl in Bath, who lately died at the age of nine years and eleven months. A very little while before she died, as the sorrowing friends stood around her, watching the last movings of the gentle breath, the last faint flutterings of the little pulse, they became aware, from her broken words, that she shrank with natural dread from the unknown way that was opened before her. She had come to the borders of the mysterious river which separates us from the dim hereafter, and her timid feet seemed to hesitate and fear to stem the flood. But after a time her fear subsided, she grew calm, and ceased to talk about the long, dark way, till at the very last, she brightened suddenly, a smile of confidence and courage lighted up her sweet face. "O, it was only a little brook!" she cried, and so passed over to the heavenly shore.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Tyler's Improved Water Wheel,

Giving the greatest power, at lower cost, than any Wheel in use. There are over 1,500 running, giving universal satisfaction.

KNOX'S AMALGAMATORS,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either Gold or Silver Ores.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10ny-tf

FLYNN & FRANCE,

EMPIRE FOUNDRY,

221 Mission street, below Beale, San Francisco, PRACTICAL IRON FOUNDERS, having unequalled facilities for the manufacture of LIGHT FANCY CASTINGS, particular attention will be given to this department. We manufacture School Seats and Desks, Agricultural Implements, Railing, Ship Castings, Stake Irons, and all other kinds of HEAVY and LIGHT CASTINGS, with dispatch. The patronage of the public is respectfully solicited. 2iv12 1y

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. & Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylindor and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Ocaring, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.

24v12 **H. J. BOOTH & CO.**

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natoma and Fremont Streets.

IRON FOUNDERS,

Steam Engine and Locomotive BUILDERS,

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition o new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Housings and Irons; and Flouring Mills, Quartz Mills, Sugar Mills, Saw Mills,

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUCINO PAN AND AMALGAMATOR

BEATH'S AMALGAMATOR;

HESSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;

BAUX & GUIOD'S AMALGAMATOR AND SEPARATOR;

FAUCHERY'S QUARTZ GRINDER AND WATER WHEEL;

JONVAL'S IMPROVED WATER WHEEL;

LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS.

STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pullies, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paling, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

LEWIS COFFEY. J. S. RISDON

LEWIS COFFEY & RISDON,

Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

SAN FRANCISCO

Foundry and Machine Works,

N. E. Cor. Fremont and Mission streets,

Manufacturers of

Marine and Stationery Engines.

Quartz Machinery, Saw, Flour and Sugar Mills, Mining Pumps, Hoisting Gear, Agricultural Implements, etc.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

The Philosophy of the Soap Bubble.

Even the little soap bubble, which has amused every school-boy and every school-girl since the invention of soap, has its little lessons of philosophical study. The great Sir Isaac Newton, whose comprehensive mind went out into the vast expansions of the etherial universe, to measure the orbits of planets and weigh suns, did not consider the little *soap bubble* beneath his consideration and careful study. In our own day, Professor Henry, of the Smithsonian Institute, has devoted much time to observing and experimenting on the extent of the mechanical action developed among the component particles of the soap bubble. Every one must have noticed that when a soap bubble has been blown to a considerable size without being forced from the tube through which it has been formed, a contraction of the bubble immediately ensues, and the air is forced back through the tube into the open atmosphere. Professor Henry, in noticing this phenomena, was led to make some calculations with regard to the tension of the thin film of liquid composing the bubble, and his conclusions are recorded in the American *Journal of Science* of 1845, to the effect that the elastic tension there developed was "equal at least to several hundred pounds to the square inch!"

Why does a soap bubble exhibit such a variety of colors? is doubtless a question that has often occurred to most of those who have amused themselves in this, usually, the first delightful experiment of every youthful philosopher. The answer is because the thickness of the film composing the bubble is constantly varying; and the degrees of thickness in the film produce different powers of refraction, and therefore as the thickness of the film varies, different colors reach the eye.

But why is the soap bubble so constantly changing its thickness? asks one.

The answer to this is, first from the distending action caused by forcing in the air, thereby increasing the size of the bubble; and subsequently, and more particularly, by the water running down from every part of the upper circumference of the bubble till the crown or upper part becomes so thin as to burst. The thinner the film the brighter and more beautiful the rays. Like the "bubble, reputation," it always bursts when it reaches its climax.

To be ephemeral, "a moment here, then gone forever," is so well known a characteristic of a bubble, that we use the word to denote anything that will quickly pass away. Now, however, in this age of variety, we have made a change even in soap bubbles, so that once formed they can be preserved for a considerable time. They can also be made so large that they will not go into a school-boy's hat. Then, again, these rainbow bubbles are so tough, or rather, elastic, that they can be let fall from a hight of six feet on to a carpet or worsted table-cover, and made to roll about with every breath hither and thither, and yet not burst. You can even play at battledore and bubble in this way: Having taken two ordinary battledores, covered with green baize, blow a bubble, and toss it from one to the other. Sometimes you can have two bubbles, or even three afloat at one time. The directions for making them are given as follows:

Take one gill of water that has boiled and got cold, and put into it a quarter of an ounce of castile soap, cut up fine. Put this into a pint bottle and set it into hot water, in a saucepan on the stove; there let it remain an hour or so (now and then with a shake up), till the soap is dissolved. Now let the fluid stand quiet for a few hours for the impurities and coloring matter of the soap to settle; then pour off the fluid, and add to it two ounces of glycerine, and your bubble solution is ready. In an ordinary way, you may blow the bubbles easily with a clean tobacco pipe; but if you wish to attain scientific perfection, you had better employ a glass pipe. The iridescent colors displayed by these spheres in sunlight are so brilliant that the term "Rainbow Bubbles" scarcely convey a correct idea of them.

There doubtless remains much more of the hidden principles of science yet to be discovered by studying the formation and phenomena of "bubbles," than "men have yet dreamed of in their philosophy;" but enough for the present.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

EUROPEAN METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Oressent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

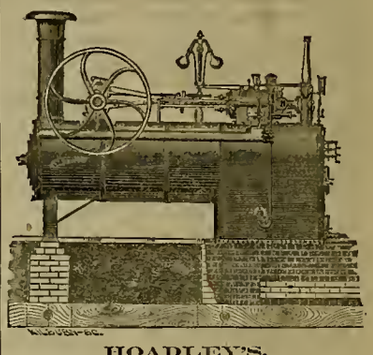
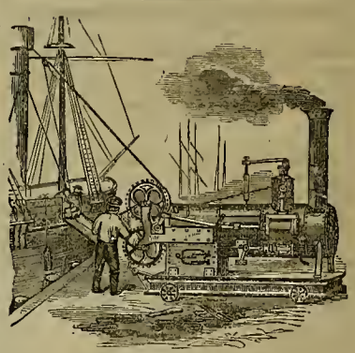
8, 10, 12, and 15-Horse Power,



HOADLEY'S.

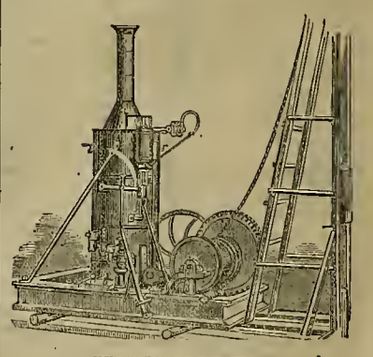
3 to 40-Horse Power.



HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power



HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURability, and Economy, with the Minimum of weight and price

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by **TREADWELL & CO.,**

18v12 Corner of Front and Market streets.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

TRY IT 50 PER-CENT SAVED BY USING

STANDARD SOAP COMPANY'S WASHING POWDER,

THIS POWDER IS SUPERIOR TO ALL OTHER PREparations for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for using in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at **207 Commercial street**, San Francisco. 15v12q

Pacific Mail Steamship Co's THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 118 and 132.

That is, the respective mullers heing of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has heen attained in no other than that of the Tractory form—nor can it he.

Another property of excellence in this machine is that the metal or substance to he amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having heen burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

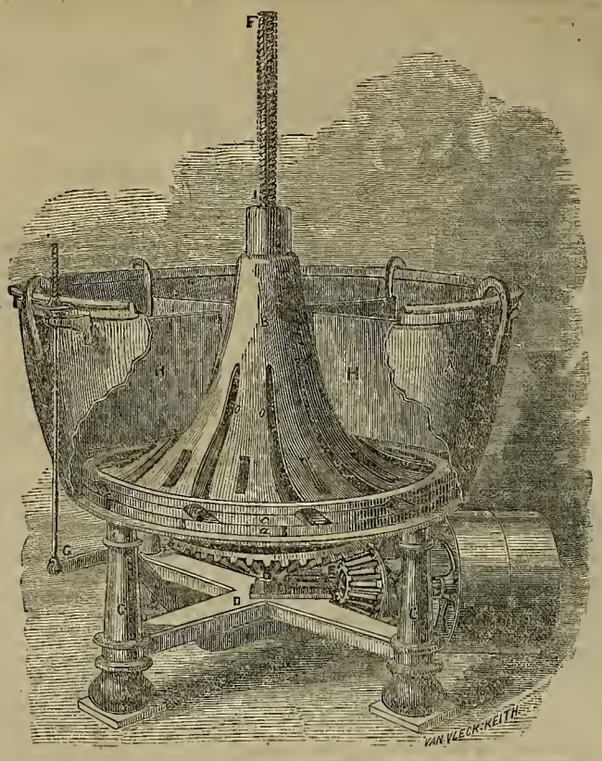
As a whole, it is far superior to any other pan in nse.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.



Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

BRUCKNER'S
Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED after an improved mode of construction, which

GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxydizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

will soon be more fully described and illustrated in the columns of the MINING AND SCIENTIFIC PRESS.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,
19v12 416 Market street, San Francisco.

Machinery.

SAVE YOUR MONEY AND BUY,

For $100!

HUNTER'S

Premium Concentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY IMproved and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 135 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent. more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 118 Washington street, below Davis, where ALBERT JACOBS will fill their orders promptly.

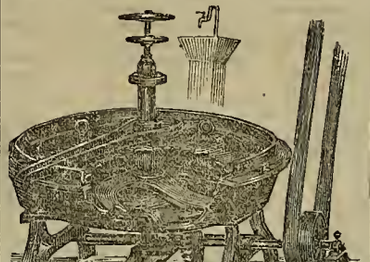
13-v12

BAUX & GUIOD S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugb & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

Hungerford's Concentrator!

—FOR—

SAVING GOLD, QUICKSILVER,

—AND—

SULPHURETS.

MORGAN HUNGERFORD HAS MADE IMPORTANT improvements on the original HUNGERFORD & PRATER CONCENTRATOR, whereby the construction of the machine is simplified, and its operations rendered more complete and easy. It is made more effective by being self-discharging, and delivering the sulphurets more free from sand and dirt.

The Machine can be seen in operation at the Miners' Foundry, 21 First street. Call and examine for yourselves before accepting the opinions of persons more or less interested in other machinery.

Hours from 10 to 12 M. and 1 to 3 P. M.

It should be borne in mind that Mr. HUNGERFORD is the original builder and maker of the celebrated PRATER CONCENTRATOR, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

The new Concentrator will soon be illustrated and described in the MINING AND SCIENTIFIC PRESS.

Address: M. HUNGERFORD,
22v12-tf Miners' Foundry, San Francisco.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—Nye County News.

CURIOUS ORIENTAL CUSTOMS.—There are many traits of character and customs in which the Arabs and Turks are our antipodes. They shave the head but not the chin, and we the reverse. With us the uncovering of the head in the presence of another is a mark of respect; with them a mark of disrespect. When they go into a place of worship they keep on their hat and take off the shoes and slippers; we do the opposite. They mount on the right side of a horse, and we on the left. They write from right to left, and we from left to right. We show our good breeding by taking the outside when passing persons on the street; they by passing nearest to the wall. They do the honors of the table by serving themselves first; we serve ourselves last. If a friend inquires after your wife you regard it as a compliment; to inquire after theirs is an insult. Their mourning dress is white; ours black. They finish their wooden houses from the top downward; and we from the foundation up. The men wear frocks and the women pantaloons. We wash the hands by dipping them in water; they by having water poured upon them.—*Bausman's Sinai and Zion.*

PRODUCTS OF LATROBE.—A correspondent, writing from Latrobe to the Mountain *Democrat*, says: There has been over three hundred tons of clay and eight hundred tons of marble shipped from that place during the past year, and the present year will undoubtedly quadruple these figures.

DR. FRANKLIN, speaking of education, says: "If a man empties his purse into his head, no man can take it from him. An investment in knowledge always pays the best interest."

ONE of the finest qualities in a human being is that nice sense of delicacy which renders it impossible for him ever to become an intruder or a bore.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

FLORENCE
SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO THE—

Florence Sewing Machine Company,

FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

1st.—Its simplicity and great range of work.

2d.—The Reversible Feed Motion.

3d.—The perfect finish and substantial manner in which the machine is made.

4th.—The rapidity of its working and the quality of the work done.

5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

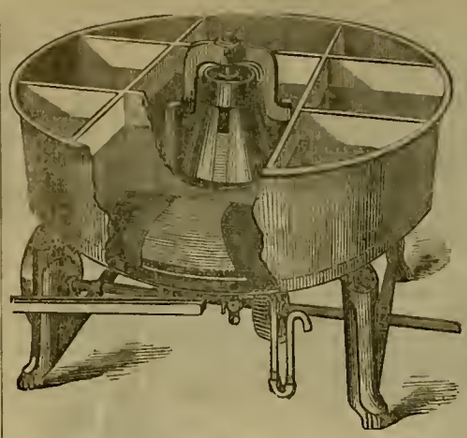
Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

SAMUEL HILL, General Agent,
20v12-14w 111 Montgomery street, San Francisco.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of FOUR YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

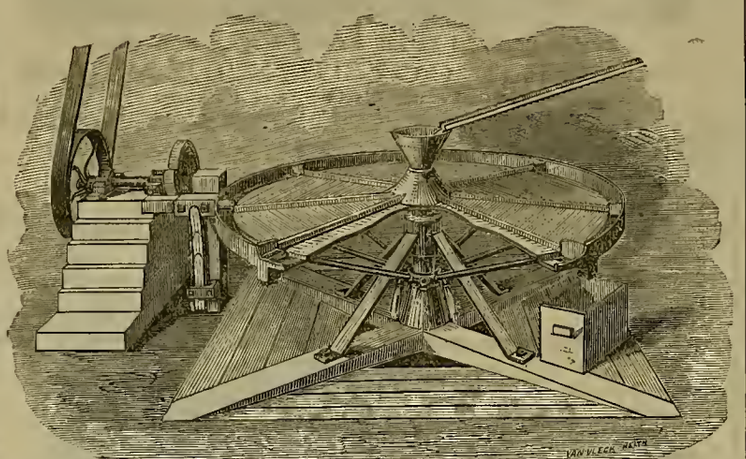
3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

☞ For further particulars, inquire of ISRAEL W. KNOX, OR W. A. PALMER, Inventors,
14v13-pl2q At the Golden State Iron Works, No. 19 First street, San Francisco.

VARNEY'S CONCENTRATOR,



With a disk 4 1-2 feet in diameter—total weight of Machine 350 pounds.

Is driven by one-eighth of a horse-power, and will concentrate eight tons of ore per day, and make the sulphuro t clean. Larger ones do work in proportion to size.

REMINGTONS'
ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a TOP STRAP or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

LEFFEL'S
American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

TWELFTH VOLUME.—The MINING AND SCIENTIFIC PRESS, published at San Francisco, commenced its twelfth volume on the 6th inst.—[Nye County News

BULLION FIGURES FROM GOLD HILL, NEVADA. The Gold Hill *News* says that during the week ending June 2d, there was shipped from the Gold Hill express office 4,272 pounds of bullion, worth $144,562.27.

During the month of May, 1865, there was shipped from the same office, bullion assaying $608,296.70. So that during the year there will be between seven and eight millions worth of the "rale stuff" extracted from the Gold Hill mines, and sent to the mint. Shipments from elsewhere in the county may make Storey's annual yield amount to the round sum of ten millions. But this simple statement places Gold Hill ahead of all mining sections on the little American district that reaches from the Sierra Nevada to the Mississippi. And, as a prominent superintendent remarked to us this morning, "Give us a railroad hence to the Truckee, and we will turn out five times the amount in less than a year after the trains commence making the through trips."

IDAHO,—The *Flag* gives an extract from a private letter from Ruby City, dated May 27th. We quote:

"I have no advice to offer to those who contemplate leaving California and coming to this section of country. If I knew what was best, I would; but I do not. The mining season is short here, and the winters intensely cold and dreary. California climate will be better appreciated and more highly prized by a person who has passed a year here. The rock may be richer here, but the expenses of reducing it is much greater than in California."

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the MINING AND SCIENTIFIC PRESS, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner. NOTICE TO QUARTZ MINERS.

Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., "
OPHIR G. & S. M. CO., Newcastle, Placer County.
CONEY MILL, Jackson, Amador County.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:

One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Eight Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Dodge & Bro, San Francisco.

They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

☞ For explanation or the above engraving, and other particulars, send for a Circular.

BANCROFT'S CATALOGUE OF

SCIENTIFIC BOOKS.

CONTENTS:

I.—Military and Naval Science.
II.—Navigation and Shipbuilding.
III.—Architecture and Carpentry.
IV.—Fine Arts.
V.—Chemistry and Electricity.
VI.—Mechanical Science.
VII.—Applied Mechanics and the Useful Arts.
VIII.—Currency, Trade, and Resources.
IX.—Mathematics and Engineering.
X.—Astronomy.
XI.—Geology, Explorations, and Meteorology
XII.—Geology, Mining, Etc.
XIII.—Natural History of Animal Kingdom.
XIV.—The Vegetable Kingdom.
XV.—Agriculture.
XVI.—Domestic Arts.
XVII.—Amusements, Games, Fortune Telling.
XVIII.—Phonography.
XIX.—Cyclopædias and Dictionaries.
XX.—General and Popular Science.
XXI.—Miscellaneous Works.

The Catalogue will be mailed to any Address upon application.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

Published by H. H. BANCROFT & CO.

Mining and Scientific Press.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS And Patent Solicitors. | SAN FRANCISCO, SATURDAY, JUNE 30, 1866. | VOLUME XII. Number 26.

TABLE OF CONTENTS.

Rider's Patent Steam Blower, illustrated
Kosalin and other Fire Clays
Source of the Electric Current in the Voltaic Battery
Mining in Aurora
Senator Conness' New Mining Bill
A Silver Mountain Mine.
Sulphurets in Gravel Diggings.
The Grain Crop of 1866.
Badly Interred
A Scientific Miracle.
Excelsior Stock Board.
Who Discovered Gold?
Cannel Coal in the United States of Columbia.
From San Bernardino county
Familiar Science.
Index for Vol. XII.
An Old School House Contract.
Mechanical.—The Hardening of Iron; Expansion of Metals; A Substitute for Emery; Gold, Iron and Coal; Another Improvment in the Thermometer; American Iron Ore in England.
Inexhaustible Ivory.
Mining Summary.—California Nevada, Idaho, Arizona, Montana, Colorado, Utah.
Editorial and Selected.
Mining Shareholders' Directory.
Stock Sales and Reports.
San Francisco Prices Current
New Mining and Other Advertisements, etc.

MINING SHAREHOLDERS' DIRECTORY,

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals].

Comprising the Names of Companies, District or County of Location; Amount of Assessment; Date of Meeting; Date of Delinquent Sale; and Amount and Time of Payment of Dividends.

Change in Prices.

Single Copies of the Mining and Scientific Press will hereafter be sold at FIFTEEN (15) CENTS. The rates of Yearly Subscriptions remain as heretofore—$5 per annum. The price to News Agents will be advanced 1¾ cents per copy. Agents in the Interior supplied. June 30, 1866.

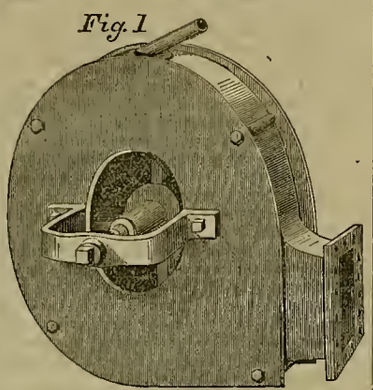
New Mining Law.—Private advices from Washington state that there is a strong probability that the Mining Bill, which Mr. Conness has offered as a substitute for Mr. Sherman's bill, will probably become a law. The interest which thus attaches to this bill has induced us to give it in full in our columns today.

RIDER'S PATENT STEAM BLOWER.

We give annexed a representation of this new blower, which was patented in January last, by Alexander K. Rider, of Hydeville, Vt., and first illustrated in the *American Artisan* of Feb. 21, 1866. This, although constructed after the manner of the ordinary blowers, is quite different in its principle and mode of action. It is driven by the direct action of a jet of steam, which is also brought in contact with the fuel in connection with the volume of air it carries along with it.

The steam is admitted through the pipe, which is seen entering the blower upon its

Fig. 1



upper side, and is impinged upon the blades or fans which may be seen through the opening in the centre of the figure. The air is also drawn into the case through the same central opening, and carried round with the steam and discharged at the outlet as usual, as shown at the right of the base of the figure.

It is claimed, that by using the steam in this manner the quantity employed is no greater than though it was applied in the ordinary manner of driving the machine; while, by thus forcing it directly into the fire in connection with the air, it produces a beneficial influence in increasing the effective heat of the fuel, and in preventing clinkers. It is also claimed that this method has the advantage of forcing into the furnace more air than the blower could do were the steam applied to driving the blower by the use of a pulley. Several jets may be used for large blowers; and exhaust steam may be advantageously applied, either alone or mixed with live steam direct from the boiler. The invention appears to be well worth the attention of mechanics.

Another Curious Experiment.—To the various and interesting illustrations of capillary attraction lately given in the Press, allow me to add another:

Take as much loose dry cotton as you dare press into a small tumbler or wine glass, and lay it by itself. After carefully cleansing and drying the edge of the glass, fill it heaping-full of alcohol. Now with a careful hand you may, by degrees, add the cotton to the alcohol, till the whole is again put in the same glass, without causing a single drop of the alcohol to overflow. Prof. Jeioh Arrh.

Peterson's New Crusher.—Mr. Peterson, of the firm of Hepburn & Peterson, has invented a new rock crusher, which we think will be satisfactorily heard from in due time.

A SILVER MOUNTAIN MINE.

No claim in Silver Mountain mining district seems to have commanded more attention in the past, or holds out prospects of a more hopeful future, than the George Washington. This was among the earliest of the claims located in that district, having been recorded on the 16th of June, 1861, and embraces an extent of 2,750 feet. A large amount of work has been done in the way of developing the claim, and its managers now feel fully warranted in taking the preliminary steps toward preparations for reducing the ore, which the Superintendent thinks he will soon be able to obtain in quantity sufficient to keep a small mill running.

The mine has been opened, first by a surface tunnel, cutting the vein at a depth of about 40 feet; afterwards by a shaft 71 feet, which was subsequently continued down on the vein to a depth of 110 feet. From this point a drift was run upon the vein 45 feet, which is said to develop a well defined lode and good ore; but just there a large influx of water compelled a temporary abandonment of the work, and a tunnel was started to cut the vein at a depth of about three hundred feet. This tunnel, which is supposed to be within 30 or 50 feet of the vein, with the work still going on, has already been connected with the old workings by an up shaft through which they are drained.

Assays from various parts of the vein have been made, from time to time, which indicate a good mine; and a few weeks since Mr. Charles Uznay, an assayer of this city, was appointed to visit the same for the purpose of examining and reporting upon its value. His report is highly flattering, and upon the strength of the same, arrangements have been made for leasing the Whiteside's mill, near by the mine, and a small assessment has been levied to provide funds for starting it up, and building a furnace for roasting the ores.

It is seldom that we have seen better working ore than the specimens which have from time to time been sent down from this mine. Mr. Uznay made numerous assays to satisfy himself with regard to the value of the ore, certificates of which we have examined. We notice ore from the upper tunnel giving $75.81 in silver, and $12.59 in gold, equal to $88.36 per ton. Another from the bottom of shaft, some 70 feet lower, gives silver $423.30, gold $37.66, equal to $460.96 per ton. A sample of decomposed or disintegrated rock, considerable quantities of which he reports in the mine, yielded $200.91 in gold, and $56.86 in silver, or $257.77 per ton. Mr. Uznay and Mr. W. D. Root, the Secretary, will soon go up to the mine and commence active prepartions for milling. Mr. Uznay thinks the first lot of 50 tons of selected rock will yield three to five thousand dollars. We hope his anticipations will be fully realized, and that the George Washington will soon be making its monthly shipments of bullion to this city.

The affairs of the company seem to be efficiently managed under the charge of Mr. Root, as Secretary. In looking over the books, we were particularly struck with a new form of Stock Ledger and Transfer Journal, which have been devised by Mr. A. G. Wood, of this city, and which are employed by Mr. Root. To our mind they certainly present a decided advantage over the ordinary forms of such books. The books and papers of this company are securely kept in a substantial safe, and the Secretary showed us a package which he said contained the original transfers to the company, all of which he has had duly recorded. He expects they will soon represent a large and valuable dividend paying property. We hope they may.

The Grain Crop of 1866 bids fair to far exceed any previous crop on this coast. It has been estimated that the yield of wheat and barley will exceed the demand for home consumption by at least 300,000 tons. The excess of last year was only about 13,000 tons; but it should be recollected that came in upon an exhausted market, while the present crop will be received upon a full one. The fear is beginning to be expressed, that sufficient shipping cannot be obtained on this coast, during the next six or eight months, to take away the surplus of our grain crop to where it can find a market. Last year, 50,000 tons of shipping left this port in ballast to load elsewhere for a return market. This year, all that surplus of shipping will find ready business at our own wharves, and we shall want still 250,000 tons more. Where will it come from, and what will our grain growers do without it? However, when the demand for shipping here becomes fully known abroad, and time has elapsed for such shipping to reach here, our wharves will doubtless be crowded with the needed fleet, and our citizens will one and all realize and feel the added impulse which such a traffic will impart to business. We may reasonably look for a much livelier time than usual in San Francisco the coming fall and winter.

A Scientific Miracle.—Professor Doremus recently delivered a lecture in New York, in which several illustrations explanatory of the constitution of gun cotton were described. He showed that linen as well as cotton, or indeed any other cellulose vegetable, could be used for this purpose. The lecturer once placed a linen handkerchief in an explosive condition, and then threw it into the wash. His servant girl washed, dried, and sprinkled it ready for ironing, without being aware of its character. The moment she placed the hot iron upon it, the handkerchief vanished into thin air, much, of course, to the astonishment of Bridget. Had such a thing occurred before the principles of science were so generally understood as they now are, it would have been attributed to supernatural agency. The mysteries of science are wonderful, indeed.

New Calendar Clock.—Mr. W. J. Eghert, has placed in our office one of Horton's Patent Calendar Clocks, which appears to be just the thing for a well regulated counting-house, office or saloon. It has two dials, the first being the same as an ordinary clock; the second has but one point, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. Parties can examine the instrument at our office. Mr. Eghert arrived by the last steamer, and can be found at 631 Washington street.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Source of the Electric Current in the Voltaic Battery.

BY EDWARD PIQUE.

Whenever two different metals, for instance, copper and zinc, are immersed in a fluid capable of conducting electricity, and the two metals touch each other, either within or without the fluid, an *electric current* will at once be established, and a *chemical decomposition* of the fluid will take place at the same time, in such a way that one of the constituents of the fluid, which necessarily must be a compound body, will be attracted by one metal, and the other constituent by the other metal. If these metals possess sufficient affinity for the constituents of the fluid, they will form a connection with them; in the contrary case, the separated elements of the compound solution will be eliminated.

If these effects do not appear by using one pair of different metallic plates, they are sure to take place by using a number of them, and connecting them in the proper way, whereof the explanation can be found in any treatise on electro-metallurgy.

To make this better understood, let us connect about ten pairs of copper and zinc plates, in the manner generally adopted by any electrician, with a piece of platinum attached to each end of the battery. If we dip these two pieces of platinum in water, slightly acidulated by sulphuric acid, the water will be decomposed into its elements, the oxygen will rise in bubbles on the positive platinum—that is the one attached to the last plate of copper—and the hydrogen on the negative platinum, which is attached to the last zinc plate. The reason is that the platinum has no affinity for either of the constituents of the water; therefore, the water being decomposed, both the above gases escape. If the terminal plates are made of copper, instead of platinum, the hydrogen will appear in bubbles on the negative plate; but no oxygen will appear on the positive copper plate, because the copper connects with the oxygen, forming oxyde of copper, which dissolves in the dilute sulphuric acid, exposing again a metallic surface to renewed action, until all the positive copper plate is dissolved.

If we employ a solution capable of being decomposed by hydrogen—as, for instance, a solution of sulphate of copper—no hydrogen will escape; but it will connect with the oxygen of the oxide of copper, and at the negative pole metallic copper will be deposited.

These actions being understood, it appears that whether hydrogen and oxygen, both of them or only one of them, or neither of them, are evolved, the original influence is always the same; the appearances only being modified by the disappearance of the oxygen in connecting with the positive metal, if this be oxydizable, or the reducing action of the hydrogen on some oxyde contained in the solution. In seeing these changes going on, no one will doubt for a single moment that a chemical action is taking place. Just as plain are the evidences of an electric current being active, which can be easily proved in different ways. One proof is by applying the galvanometer. This consists of a rectangular coil of copper wire, containing about twenty convolutions, the wire being covered with cotton or silk, to prevent the lateral escape of the current. A magnetic needle, supported on a pivot, is placed in the center of the coil, and a card, graduated into 360°, is fixed to the board on which the coil rests, so that a line drawn from 360° to 180° coincides with its long axis. We place this instrument in such a position that the wire coil is precisely in the magnetic meridian, and consequently the needle and coil, both, will be parallel and point nearly north and south.

We form now a galvanic pair by immersing a copper and a zinc plate in water, slightly acidulated with sulphuric acid; but instead of forming immediately a metallic connection between the two metallic plates, we solder a copper wire to each of the plates, separate the plates from each other, and fasten these two wires each to one end of the coil of wire surrounding the magnet, the ends of which must be laid bare from their silk covering, so that metal shall touch metal. The moment that these connections are completed, the needle will move to the east or west, which is a positive proof of an electric current traversing the wire.

Another satisfactory proof of the same fact, is given by the calorific effects of electricity. We take two plates of copper and zinc, which for this purpose ought to be at least four inches long and two broad, the larger the better; we place them, separated, in the dilute acid, then connect them by a piece of very fine platinum wire, half an inch in length. The platinum wire will become brilliantly ignited; and this is a positive proof of an electric discharge taking place through it.

Some more proofs of the existence of an electric current in this case could be produced, but those already given are quite sufficient.

Now no one denies that in a galvanic battery an electric current is established, and a chemical action takes place; but which of the two is the cause, and which the effect, is a question which the most learned men have for a number of years disputed, without being able to agree in opinion. Dr. Wollaston, Dr. Faraday, and several others, believe that the chemical action of the acid solution on the zinc, or rather of the zinc on the water of the acid solution, is the source of the electric current in the voltaic battery; and this is termed the CHEMICAL THEORY of the pile. Other philosophers, following the opinion of the illustrious discoverer, Prof. Volta, of Pavia, believe that the chemical action is the effect of the electric current, and that the power is produced by the contact of two dissimilar metals—this latter has received the name of the CONTACT THEORY. It is certainly a matter of the greatest importance to know the source or origin of a power that has been applied to so many useful purposes, and which promises for the future so many additional uses; and it is very much to be regretted that learned men cannot unite in one opinion, because when two exist, one must be right and the other wrong, and the student gets bewildered, not knowing which opinion should be received. If our ideas about the source of voltaic action were clear and correct, we might be enabled to produce and regulate that power with more certainty, and perhaps more economy; but as long as we do not know the source of power, we shall always be groping in the dark.

The great obstacle in clearing up our notions about any mysterious law of nature, has always been the vanity of some learned men, who, fond of some preconceived notion, cannot bear that any one should contradict their pet idea. A curious instance of this truth is found in the early stages of chemistry. In the beginning of the eighteenth century, a German chemist, named Stahl, founded the phlogistic theory of chemistry, asserting that every combustible body, as, for instance, the metals, contain a matter which he called Phlogiston. Observing that the metals, when oxydized by combustion or otherwise, lose their metallic properties, Stahl and his followers believed that the metals gave up their phlogiston, and losing this they are no more metals. In the year 1783, Lavoisier proved that the metals, when oxydized by combustion, or otherwise, weigh heavier than they did before; for instance, one pound of copper, when thoroughly roasted, will give a pound and a quarter of a black powder, etc., etc.

Now, although any man in his right senses, when seeing that four pounds of copper, after being burned, weighed five pounds, must have been convinced that it *gained* something; still, for about twenty years after this discovery, some of the most learned men disputed this fact, and firmly believed that the metals under these circumstances actually *lost* something. Such was the opinion held by many until the discovery of the different gases and their properties of connecting with solid bodies, put an end to these ridiculous controversies.

If we seek for truth, neither vanity nor prejudice should influence us. We cannot make nor change the laws which the Almighty has impriuted upon nature; we are fortunate if we can only trace them.

It would be useless for us to describe all the numerous experiments which have been made, to prove that almost every chemical action produces a current of electricity; in most cases, however, of very weak tension. It is certain that electricity produces chemical action, when the current traverses different bodies capable of being decomposed, and the electricity is of the proper tension; no difference whether the electricity be generated by friction or a galvanic battery, or the motion of a magnet, or by any of the numerous ways that will generate electricity. Our object is to inquire into

THE SOURCE OF THE ACTION IN A GALVANIC BATTERY.

Is it a chemical action which starts the electricity, or is it electricity which here produces decomposition?

To decide this point, I wish to answer three questions.

The first question is—Will two different metals, by mere contact, produce electricity without any exciting fluid whatever? My answer is—yes.

Two disks of different metals, when pressed together and suddenly separated, assume opposite electric states. To demonstrate this, take a plate of copper and one of zinc, about four inches in diameter, each furnished with a glass handle fixed in its center; now connect a gold leaf electrometer with one plate, A, of the condenser, allowing the other plate, B, on the condenser, to be connected with the earth. Press the copper and zinc plates together, holding them by their insulating handles; suddenly separate and apply one of them to the plate, A, of the condenser; again press them together, having previously touched them with the finger to restore their electric equilibrium, and reapply the same plate to the same condenser. Repeat this about six times; then draw back the uninsulated plate, B, and the gold leaves of the electrometer will diverge with positive electricity if the zinc, and with the negative if the copper plate has been applied to the condenser.—[*Dr. Bird's Natural Philosophy.*]

The second question to be answered is—In constructing a galvanic battery, are we making arrangements favorable to a chemical action? I answer—No.

If we dip a plate of zinc in dilute sulphuric acid, it will cause a rapid evolution of hydrogen gas, which will escape along the plate of zinc, until all the zinc will be dissolved—if a sufficient quantity of acid be present. This is called a chemical action, and every chemist knows that the zinc combines with the oxygen of the water, that the oxyde of zinc so formed is dissolved in the dilute sulphuric acid as sulphate of zinc, and the hydrogen, thus set free, escapes along the zinc.

We now place a plate of copper in the same acidulated liquid, separate it from the plate of zinc, and connect the two plates together outside the fluid by a wire previously fastened to each plate. What will be the result? We shall see hydrogen escaping from both plates—the copper as well as the zinc—and we say, that the hydrogen escapes from the copper in consequence of an electric current, as the copper-plate does not undergo the slightest change; neither does the copper gain or lose anything. Chemistry cannot account for this, and it is universally acknowledged, that only the quantity of hydrogen escaping from the copper, is in proportion to the electricity, and therefore it has been used to ascertain the relative quantity of electricity which is active. The hydrogen escaping from the zinc, cannot be taken in account. It is an unnecessary waste, and therefore means have been devised to prevent the local action of the acid on the zinc, by coating the zinc plate with mercury.

The surface of the zinc is cleaned with a little acid, and a few globules of mercury are rubbed over it, and we call it then *amalgamated*. If we dip this amalgamated zinc plate in dilute sulphuric acid, it assumes a grayish tint from its becoming covered with myriads of excessively minute bubbles of hydrogen gas, which mechanically adhere to its surface, and thus form a gaseous covering, which shields it from the further action of the acid. We can see quite plain that there is an end to the chemical action. We now immerse a copper plate in the same dilute acid, and form a metallic connection between the copper and the amalgamated zinc plate, when in an instant a torrent of bubbles of gas is evolved from the copper, no evolution of gas from the zinc taking place. The copper, however, remains chemically unacted upon, and the zinc is alone dissolved, in proportion to the quantity of hydrogen escaping from the copper.

This answers my second question, whether in constructing a galvanic battery we are producing conditions favorable to chemical action. *We do not.* On the contrary, we arrange it so as to impede the chemical action; we coat the zinc with mercury, and this prevents the dilute sulphuric acid from acting on the zinc, which is not at all consumed or in any way altered, until we dip another more negative metal, for instance copper, in the same fluid, and form a metallic connection between the two metals.

If it were true, that in a galvanic battery chemical action produces electricity, would it not be reasonable to expect, that uncoated zinc should produce a larger amount of electricity than the amalgamated zinc; since the uncoated zinc gives rise to a very powerful action, when dipped in dilute acid, while the amalgamated zinc excites no chemical action whatever.

We employ a similar proceeding in the protected sulphate of copper batteries. In using, for instance, porous cells, it is not necessary to amalgamate the zinc; but then we must not allow an acid solution to be in contact with the zinc, because it would consume the zinc, without giving us any benefit. We ought only to use solutions that have no chemical influence on the zinc; for instance a solution of common salt, or sulphate of zinc, and so on. We do not want the zinc to be touched by any solution capable of acting on it. How can we then reasonably imagine, that the chemical action of the zinc on the surrounding fluid excites electricity, if no chemical action of any kind is present?

The third question I wish to answer, is from which plate originates the power? Is it the zinc or the copper plate? By what I have already said, it is clearly understood, that the action showing itself on the negative or copper plate, is regarded as an electric action, because it cannot be explained by the laws of chemistry. This action might consist in the evolution of hydrogen, or in the reduction and deposit of a metal on the negative plate, which amounts to the same, as far as the kind of power is concerned that produces these effects. It is likewise understood that the action on the zinc or positive plate, is considered a chemical action, and consists in the oxidation of the zinc, which consequently is dissolved by the acid, which forms a constituent of the liquid surrounding it.

To answer our question, let us suppose we have a vessel divided into two copartments by a porous diaphragm, it might be a bladder, unglazed earthenware, or anything else of this kind. In one division of the vessel we put a solution of sulphate of copper, and in the other division a solution of sulphate of zinc. In the first solution we immerse a copper plate, and in the last solution a zinc plate, and connect the two plates by a copper wire. What will be the result? The copper of the solution will be deposited on the copper plate, and the solution of sulphate of copper will be in the end so exhausted, that hardly anything but water will be left in its place. On the other side the zinc will be dissolved, and the solution surrounding it will be concentrated, and contain so much sulphate of zinc, that, if proper precautions be not taken, it will even crystallize. Now let us try to explain this final result by two different and opposing suppositions to find out which is the correct one.

[To be Continued.]

[Written for the Mining and Scientific Press.]

Mining in Aurora.

EDITORS PRESS:—My letters of late have been few and far between, owing to the scarcity of subject matter hereabouts. My object is only to write you of matters of interest in general on mining.

For the past three or four months, work has been going steadily on in this district, that will eventually test the value of the mines, and prove the existence or non-existence of its mineral wealth. Past experience teaches the futility of gouging out mines on their surface, with any hope of making them permanent paying institutions. It is only by sinking to the *core*, where the real formation of mineral lies, that will give any lasting stability to a mine. This now seems to be the determination of the owners of at least a few of the leading lodes here, and if their efforts should be crowned with success (of which I have not the least doubt), hundreds will follow in their wake. There are many mines working that pay their way, independent of those sinking for a test. Among the former,

THE PHILADELPHIA COMPANY

Is driving its work along with a vigor and force very creditable to the superintendent, Mr E. O. Taylor. Their shaft, intended to be 500 feet deep, before they commence drifting into the hill, is situated in Wide West Gulch, a short distance above the famous Wide West mill, on the west side of Last Chance Hill. They are now down about eighty feet, and are making from three to four feet a day. The strata through which they are working requires but little blasting, being composed of a mixture of decomposed quartz and bed-rock. The shaft is eight by four and a half in the clear, and as fine a piece of work as I have have ever seen. This company have a tunnel running into the hill from where their shaft is located, some 600 feet long; and in that tunnel they have six well defined ledges. When they attain the depth of 500 feet, I predict for them a brilliant success. Mr. Taylor is now in San Francisco, looking after the shipment of some $50,000 worth of machinery, which he started for this purpose prior to his leaving Philadelphia.

THE GOLDEN AGE AND EMPIRE COMPANY,

On the summit of Last Chance, are driving their work bravely on, under the able management of Capt. George Benson. They are run-

ning a night and day shift, and are down with their perpendicular shaft about 220 feet. They, too, intend sinking 500 feet before drifting. This company has shown more stirring determination than any company in the camp. Last year they sunk to the depth of 270 feet, on an incline; but being obstructed with water, they abandoned that undertaking, came up to within 140 feet of the surface, squared their shaft, and started in anew to sink perpendicularly. They hoist their dirt by the aid of a whim, until they again encounter water, when it is the intention of the company to put on steam hoisting machinery. This machinery, I understand, is all ready in San Francisco, to be shipped at a moment's notice, when it is seen that it will be required. There are a number of valuable mines in the vicinity of this one, that will certainly reap the benefit if anything is struck in this company's works.

THE CROCKETT,

Situated just below the Golden Age and Empire, is working away. Their mine has rock that pays well. The manager, Mr. Gallagher, is working it on an economical scale, and in a manner that has so far proved very satisfactory. I am informed that it is his intention to continue doing so until the development of the Golden Age and Empire; as that company will demonstrate in its workings the existence of new developed lodes, at the depth they propose to go; and the Crockett being in such close proximity, it is but reasonable to conclude, that if found by the one, the others will have it also; and among them all the Crockett stands the best chance, as they have now a well defined ledge from twenty-eight feet of the surface to the depth of 150 feet, averaging from two to four feet in width, that will pay as it comes out of the mine from $80 to $100 if properly worked. Two thousand two hundred pounds of assorted rock from this mine, was worked recently by a Mr. S. F. Clouser, from your city, and yielded the handsome return of $800 to the ton. Refuse rock, such as they have been throwing away, yielded $80 to the ton; showing conclusively that the downfall of this camp is mainly to be laid to the want of ability on the part of the millmen here to get what is really in the ore. *

Aurora, Nevada, June 14, 1866.

SENATOR CONNESS' NEW MINING BILL.

The following Bill to regulate the occupation of mineral lands, and to extend the right of pre-emption thereto, was reported in the Senate of the United States, May 28, by Mr. Conness, Chairman of the Committee on Mines and Mining:

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled.

SECTION 1. That the mineral lands of the public domain, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and occupation to all citizens of the United States, and those who have declared their intention to become citizens, subject to such regulations as may be prescribed by law, and subject also to the local custom or rules of miners in the several mining districts, so far as the same may not be in conflict with the laws of the United States.

SEC. 2. And be it further enacted, That whenever any person or association of persons claim a vein or lode of quartz or other rock in a place, bearing gold, silver, cinnabar or copper, having previously occupied and improved the same according to the local custom or rules of miners in the district where the same is situated, and in regard to whose possession there is no controversy or opposing claim, it shall and may be lawful for said claimant or association of claimants to file in the local office a plat of the same so extended laterally or otherwise as to conform to the local laws, customs, and rules of miners, and to enter such tract and receive a patent therefor, granting such mine, together with the right to follow said vein or lode with its dips, angles and variations to any depth, although it may enter the land adjoining, which land adjoining shall be sold subject to this condition, and upon the further indefeasible condition, both to be fully expressed in the patent, that the owners and occupants of the mine so appropriated and held shall pay into the treasury of the United States, in each and every year until the national debt shall have been paid, three per centum of the net product of said mine, vein, or lode, which shall be in lieu of the stamp tax now levied upon bullion extracted from the public domain.

SEC. 3. And be it further enacted, That upon the filing of the plat of the survey, as provided in the second section of this Act, the Register of the Land Office shall publish a notice of the same in a newspaper published nearest to the location of said claim, and shall also post such notice in his office for the period of ninety days; and after the expiration of said period, if no adverse claims shall have been filed, it shall be the duty of the Surveyor General, upon application of the party, to survey the premises and make a plat thereof, indorsed with his approval, designating the number and description of the location; and upon the payment to the proper officer of $5 per acre the Register of the Land Office shall transmit to the General Land Office said plat, survey, and description, and a patent shall issue for the same thereupon; and the Surveyor General shall receive for such service such compensation as is allowed by law, with mileage not to exceed at legal rates the amount chargeable from the county seat of the county in which the claim may be situated to the said claim.

SEC. 4. And be it further enacted, That when such location and entry of a mine shall be upon unsurveyed lands, it shall and may be lawful, after the extension thereto of the public surveys, to adjust the surveys to the limits of the premises according to the location and possession and plat aforesaid, and the Surveyor General may, in extending the surveys, vary the same from a rectangular form to suit the circumstances of the country and the local rules, laws and customs of miners; Provided, that no location hereafter made shall exceed three hundred feet in length along the vein for each locator, with an additional claim for discovery to the discoverer, with the right to follow such vein to any depth, with all its dips, variations and angles, together with a reasonable quantity of surface for the convenient working of the same, as fixed by local rules.

SEC. 5. And be it further enacted, That the President of the United States be, and is hereby, authorized to establish additional land districts and to appoint the necessary officers under existing laws, whenever he may deem the same necessary for the public convenience in executing the provisions of this act.

SEC. 6. And be it further enacted, That whenever adverse claimants to any mine, located and claimed as aforesaid, shall appear before the approval of the survey as provided in the third section of this act, all proceedings shall be stayed until a final settlement and adjudication in the Courts of competent jurisdiction of the rights of possession to such claim, when a patent may issue as in other cases.

SEC. 7. And be it further enacted, That whenever prior to the passage of this act, upon the lands heretofore designated as mineral lands which have been excluded from survey and sale, there have been homesteads made by citizens of the United States, or persons who have declared their intention to become citizens, which homesteads have been made, improved, and used for agricultural purposes, and upon which there have been no valuable mines of gold, silver, cinnabar or platinum discovered, or which are properly agricultural lands, the said settlers or owners of such homesteads shall have a right of pre-emption thereto, and shall be entitled to purchase the same at the price of one dollar and twenty-five cents per acre, and in quantity not to exceed one hundred and sixty acres, or said parties may avail themselves of the provisions of the act of Congress, approved May 20, 1862, entitled "an act to secure homesteads to actual settlers on the public domain," and acts amendatory thereof.

SEC. 8. And be it further enacted, That upon the survey of the lands aforesaid, the Secretary of the Interior may designate and set apart such portions of the said lands as are clearly agricultural lands, which lands shall thereafter be subject to pre-emption and sale as other public lands of the United States, and subject to all the laws and regulations applicable to the same.

SEC. 9. And be it further enacted, That whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws, and the decisions of the Courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes aforesaid, is hereby acknowledged and confirmed; provided, however, that whenever, after the passage of this act, any person or persons shall, in the construction of any ditch or canal, injure or damage the possession of any settler on the public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

SEC. 10. And be it further enacted, That the right of way for the construction of highways over public lands, not reserved for public uses, is hereby granted.

SIX Boston merchants have contributed $5,000 each toward the new hall of Harvard College, to be erected in memory of the graduates of that institution who fell in the late war.

ONE hundred pounds of water of the Dead Sea contains forty-five pounds of salt.

Mechanical.

ANOTHER IMPROVEMENT IN THE CHRONOMETER ESCAPEMENT.—We noticed in a former issue of this paper, an improvement in the chronometer escapement by W. H. Lamb, of this city. We have since been shown yet another, also by Mr. Lamb, which, if possessed of the merits claimed, is a very important one, as it possesses many advantages over his former invention, or any other escapement in use. Mr. Lamb has taken the preliminary steps to secure a patent through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Its advantages over the lever are that an equal impulse is given to the balance, both upon its right and left vibration, direct from the scape wheel, thereby requiring only about one-half the force of a main spring which is required by the lever, and consequently is much less liable to breakage. Another advantage is its cheapness; as it can be manufactured for about one-half the cost of the lever escapement. Its simplicity of construction adds to its non-liability to get out of repair. Its advantages over the duplex escapement are, the impossibility of escaping more than one tooth of the scape wheel at each vibration of the balance, no matter how far it may vibrate; whereas in the duplex, should the balance vibrate too far, two teeth of the scape wheel will escape at each vibration, which it is very liable to do in riding horseback or jumping, etc., thereby causing the watch to gain time. The chronomotor as now in use has the same imperfection in this respect.

In addition to this, it has yet another advantages over the chronometer, which is that when the balance is at rest, the tooth of the scape wheel is unlocked, and when the force is applied to the train, impulse is immediately given to the balance, and the watch starts or moves. In the chronometer now in use, no impulse is given to the balance until it is first set in motion by external force.

AMERICAN IRON ORE IN ENGLAND.—The superior value of American iron ore was known and acknowledged in England long previous to the Revolution, and during which time considerable quantities were imported into the mother country. The Franklinite ore of New Jersey would to-day all be exported to England to assist in the manufacture of Bessemer steel, were there not more important uses for it at home.

The English engineers are now talking of importing American Salisbury iron ore to assist in making car wheels, as they have utterly failed in making good cast iron chilled wheels from any iron in England. The American cast iron wheels drove the English wrought iron wheels from the railways in Canada.

Alexander M. Ross, engineer of the Grand Trunk Railway of Canada, says in a letter: "I was myself instrumental in the introduction of the English pattern of wheel, and after two or three years' trial had to abandon them altogether."

An English engineer of note writing to Col. Simpson lately, to send him some cast iron wheels of Salisbury iron, asked him to get a guarantee that each wheel would stand a load of two tons at ordinary speed. The wheel founder said: "I will give him a guarantee that each wheel will stand twenty tons at any speed."

MANUFACTURE OF TIN PLATE.—During the last seven years the annual average value of tin plates manufactured in Great Britain, and shipped for exportation, amounted to more than $5,000,000. The largest amount, to the value of $3,590,000, is shipped to the United States. It is to be hoped that the mines of California will soon enable us to furnish our own tin.

THE PACIFIC NOVELTY IRON WORKS, situated on the Point, near Oakland, have just received as new members of the firm, Messrs. Hobart and Gardner. They have a 20-stamp quartz mill completed. It possesses some new and attractive features. The foundry is under the superintendence of Wm. Scoville.

THE HARDENING OF IRON.—A French experimentalist found, a few years since, that by heating iron tolerably free from carbon, with a small quantity of boron, to a very high temperature, he obtained a product which could not be forged, but which possessed extraordinary hardness. He has now found that an equally hard metal may be obtained by adding to ordinary cast iron, in fusion, phosphate of iron and peroxide of manganese; he does not mention in what proportion. The product cannot be forged, but it casts easily, and is, therefore, applicable to the construction of such machines or parts of machines as require in their material extreme hardness rather than tenacity. The metal is, moreover, singularly sonorous, and the discoverer proposes it as a material for bells. He finds that a still harder metal is producible by the addition of tungstein—again he omits to state in what amount—to ordinary cast iron. He states that his tungsteo iron surpasses everything previously known as a material for tools for cutting rocks, and that crystals of it will cut glass as readily as the diamond.

EXPANSION OF METALS.—Metals expand by heat, and contract by cold; and in almost all mechanical operations, unless the tendency to expand is allowed to act, very great strains are brought to bear upon the material. The following table shows the amount of expansion for different materials:

	Expansion per. deg. Fah.	Expansion from 32° to 212°.
Iron	.0000067	.00122
Steel	.0000060	.00124
Copper	.0000090	.00171
Zinc	.0000160	.00294
Tin	.0000120	.00217

Almost all solid bodies expand equally for each degree between freezing and boiling, or from 32 to 212 degrees of Fahrenheit's thermometer. A bar of iron, therefore, which is 12 feet long, by an increase of 60 degrees of temperature becomes 60x12x.0000067=12.0048 feet in length.

A FRENCH workman, some time since, constructed for the Duke of Wellington a watch of novel and peculiar construction, the idea of which was conceived by the Duke himself, who was well known to have been of an impatient temper, and could not pass half an hour in any one's society without feeling an irresistible inclination to look at his watch. Now, it is exceedingly impolite, particularly in England, to draw forth a watch in the presence of ladies, and the Duke hit upon an ingenious plan to ascertain the time without anyone present being the wiser for it. The watch constructed for him was a silent repeater. It was provided with a spring, on touching which a small hammer issued from the case and struck the hour in the palm of the person's hand holding it. The Duke had merely to slip his hand carelessly into his pocket, touch the spring, when he was immediately informed of the time of day.

A SUBSTITUTE FOR EMERY.—Among the most useful applications of waste substances to the advancement of the industrial art, we think may prove an invention recently patented in England. It is the utilization of the immense hills of slag which surround old established iron works. It is said that this refuse material may be substituted for emery, and that it is even superior to emery for polishing steel, iron, copper, and other metals. The new substance is called "metalline," and can be produced at seventy or eighty per cent. less cost than emery.

GOLD, IRON AND COAL.—According to the census of 1860, the product of the gold mines in the United States amounted to $47,163,170. The product of the coal mines, $20,243,637; iron, $23,870,120—the gold product being more than equal in value to both coal and iron. Owing to the increased area of the gold fields of the Pacific coast during the past five years, the interruption in the manufacture of iron, and increased cost of labor in the coal mines, consequent of the derangements produced by the war, during the same period, it is safe to estimate the yield of the precious metals during 1866 at double that it was in 1860; while the produce of iron and coal will probably not more than equal the value that of 1860.

COPPER ROLLING.—Government is erecting a copper and brass rolling mill at the Frankford Arsenal, Pa., which is to cost $300,000.

COPPER containing twenty-four per cent. of phosphorus will resist a strain of 48,000 pounds on the square inch.

WHITE LEAD.—A large white lead factory has been started at Louisville, Ky., at a cost of about $160,000.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, June 30, 1866.

The Money market has been steadily active throughout the week, hut without any npproximation to pressure. The line of mercantile paper under discount with the banks bas increased within the past month, and the offerings are still considerable. This takes precedence over all otber securities, even the best dividend-paying stocks, and nntil the wnnts of the mercbants are fully supplied, its effect upon tbe Mining Share market will be depressing. The rates of interest bave not deviated, and capital is ahundant at 1@1¼ ℔ cent. per montb.

Owing to the suspension of telegraphic communication witb the East, from the 18th to the 27th instant, operations have been somewhat restricted in mercantile circles, but more activity may now be looked for.

The Sub-Treasurer in this city has received nuthority to increase the "Bullion Fund" of the Bronch Mint from $500,000 to $750,000. This is a fund provided by the Government to enable the Supeintendent of the Mint to pay the depositors the amount of their deposits before they can be worked into coin. Payments have, heretofore, been made within an nverage of six days, but this increase of the Bullion Fund will enable the depositor to get his moneyas soon as the assay is made and tbe intrinsic value of his deposit can be found—ordinarily within three days.

Receipts of treasure from tbe mining districts, since the date of our last reference, nmounted to nbout $800,000, making an aggregate of $3,800,000 for the month of June. During the ensuing summer months the yield of the qnartz and other mining enterprises of this State are likely to show a larger yield than for several years past.

Bullion has continued to meet with a fnir degree of inquiry nt full rates, and gold bars are quotable at 880@890; some sales are reported at even higher figures. Silver is also in good demnnd at 1½@2 ℔ cent. premium for bars of average fineness. The Sub-Treasurer of this city made a shipment of $500,000 on Government account by the last steamer, which makes an aggregate ,thus far of $4,500,000 sent East since January 1st.

Legal Tender Notes bave been inactive, and trifling sales were made within n range of 70@72c, closing at about 71 bid, 72c asked. Government officials have received $1,000,000 in Greenbncks by the lnst steamer from the East for disbursement in this city. Latest telegraphic ndvices from New York quote gold at 151 on the 25th inst.

The Mining Sbare market continues exceedingly flat nnd spiritless, and the few instances of vigor it occasionally elicits only serve to make the general lack of vitality more marked. Transactions since Saturday last sbow the smallest weekly aggregate siuce the beginning of the yenr.

Hale & Norcross receded from $1,300 to $1,250, rallied to $1,275, dropped to $1,250 agnin, and then sold at $1,275, and closed nt $1,270@1,275. The body of ore found recently in the 585-foot level is now some 20 feet wide, and promises to become n valuable addition to the resources of tbe mine. From the 700-foot level advices are also favorable, and tbe ore is averaging $45@50 per ton.

Crown Point was sold at $960@950, and was held at the close at about $900. During the week ending 22d instant, 623 tons of ore were extracted from the mine. Receipts of bullion from the 1st to 20th inst. nmounted to $65,000. The improvements to the Rhode Island mill will be commenced next week, which will increase tbe crushing capacity of that establishment to about 60 tons per day.

Savage fell from $990 to $885, and then sold at $885, closing at $900. During the week ending 23d instant, 704 tons of ore were extracted from the mine. The fifth station, near the Gould & Curry line, is yielding a large amount of second and third-class ore, and the product of the sixth could be materially increased with better hoisting facilities. The winze from the latter is down some 50 feet in good ore. The main shaft has been sunk 85 feet below the sixth level, and the southwest drift, in tbe direction of the Hale & Norcross, is in 135 feet from tbe shaft.

Gonld & Curry has met with small sales this week at $732@725, closing at $710. Yellow Jacket rose from $650 to $703, fell to $682½, and then sold at $690@682, and was dealt in yesterdny at $687@692½. During the week ending 18th inst., 2,172 tons second and third-class, and 13 tons first-class ore, were taken from this mine, and the yield of bullion amounted to $69,186.06, making the aggregate receipts, for the first three weeks of June, $179,024.

Ophir is in less favor, and some 125 feet were sold, steadily declining from $287 to $213, then changing hnnds at $217, and selling at the close at $209@213. There is no important change to note in any portion of this claim.

Chollar-Potosi has been unusually inactive witbin a range of $187 @$185, closing at $183. The Piute station is said to be looking well, and in the Bajazette ground the winze has been sunk a short distauce (under the old Spanisb mine) in promising ore. In breasting out to the south, in the "stope overbead of incline," there is an improvement, and the ore appears to extend higher up than it did in other portions of that station. The winze from the 485-foot Potosi level is down some 50 feet in quartz. The first station drift from new shaft is now in softer rock with some water, and in going north the seam of quartz has widened, but without any improvement in quality. During the week ending 23d instant, 682 tons of ore were sent to custom mills.

Alpha has been sold at $210@$212½; closing at $206. Belcher rose from $160 to $190; dropped again to $155, and then was dealt in at $162½.

Imperial rose from $100 to $105, fell to $93, and then was dealt in at 97@106, closing at $106. The total bullion receipts of this company for the year ending May 31st last, amounted to $1,019,275.91, from 34,735 tons of ore—an average of about $29 per ton. During that period $240,000 ($60 per shnre) were disbursed in dividends to stockholders, leaving on hand a surplus balance of some $25,000 to be carried forward to the credit of tbe new year, commencing 1st instant. Receipts of bullion for the first tbree weeks of this month amounted to $34,000.

Bullion was sold at $57½@55, closing nt $57. Overmnn rose from $25 to $28½, fell to $21, and then sold at $21½@24. Confidence rose from $48 to $65, fell to $47, and was then dealt in at $47@51.

The aggregate sales of Stocks and Legal Tender Notes since Saturday last. amounted to $330,304.

A NEW MINERAL.—We learn from *Cosmos* that a new mineral has been discovered at Oravicza, in the Banat, to which M. Tschermak has given the name "Alloclaso." The mineral is composed of sulphur, arsenic, bismuth and cobalt, in the mode expressed in the formula $Co^6 As^8 S^9$, in which it is supposed that one-fourth of arsenic may be replaced by an equal quantity of bismuth. It forms rhombohedric crystals of a copperish-gray color, found in calcite, and accompanied with acicular arsenical pyrites. Breithaupt has confounded alloclase with gluncodote.

FALLING OFF IN THE OIL YIELD.—It is stated by the Pittsburg *Oil News* that the yield of oil has fallen off nearly one half in Pennsylvania since the first of January last. The cause is chiefly attributed to the excessive tax on crude oil, which effectually shuts off all but the most abundantly paying wells. The proposed new tax law, now under consideration in Congress, abolishes this tax entirely, as it should do.

RAINFALL IN CALIFORNIA.—The Nevada (Cal) *Gazette* chronicles the rainfall at that city during the past season, which it states to have aggregated fifty-six and eleven-hundredths inches. At Grass Valley it was a little less, and at Sacramento it was only a little over sixteen inches. At Sacramento there is generally less rain than in any other section of Northern California, while by far the greatest fall occurs in the Sierra Nevada.

SEALING PATENTS.—A statement is going the rounds of the press to the effect that the quantity of sealing wax now required for one year's consumption in England, for sealing patents for inventions, is upwards of a ton and two hundred weight. In England it is customary to load a patent with a seal weighing from a half pound to a pound, and if this liberal allowance of wax was made in our Patent Office at Washington, our business for the year 1866 would scarcely be done with less than five tons of sealing wax.

TIN ORE IN MAINE.—A company of Eastern capitalists, known as the National Tin Mining Company, with their office at No. 64 Broadway, N. Y. has been organized to work a tin mine in Oxford county, Maine.

QUERY.—Some one inquires through the Pittsburg *Oil News* whether any one has ever found oil flowing from a well which yields fresh water. It has been stated that there is no instance known of fresh water coming up with oil. How is it?

LEAD and zinc veins have been traced through several counties in Tennessee. One vein from Elizabethton, in Carter county, through New Market Valley, and into Anderson county, and continuing to Blount county, Powell's Valley. Lead and zinc are associated together, and are found embodied in limestone strata.

W. T. GARRATT,

City

BRASS AND BELL FOUNDER

Cor. Market and First Sts., opposite Oriental Hotel,
SAN FRANCISCO.
Manufacturer of Brass, Zinc, and Anti-Friction or
Babbet Metal Castings;

GOLVIN'S

American Cow Milker.

Fig. 2

A FEW SAMples of this novel and useful invention have arrived by the last steamer, and are now offered for sale by an agent in this city. It was illustrated and described in the MINING AND SCIENTIFIC PRESS of May 12. The actual operation of the Milker has already been demonstrated in this State. The machine may be seen at this office, where further information can be gained.
June 20th, 1866. 26v12

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,
Professor of Chemistry,
(Formerly of the Normal College, Swansea,)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half-past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

On and after the 15th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,
Principal of the City College.
6v12tf Or at 406 California Street.

SACRAMENTO SEMINARY.

BOARDING SCHOOL
FOR YOUNG LADIES,
Tenth Street, between F and G.
SACRAMENTO, CAL.
Session commenced January 8, 1866.

SANTA CLARA COLLEGE, S. J.,
SANTA CLARA, CAL.
Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignatius College, Market street, San Francisco.
3v11 REV. A. MASNATA, S. J., President.

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LECISLAture of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS.

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:
Fire.....$12,973,949
Marine..... 484,403

This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

Eyes! Eyes!! Eyes!!!

DR HENLY, OCULIST AND AURIST, HAS received from Scotland one of the most MIRACULOUS REMEDIES for the benefit of the human eye ever before discovered. It is unparalleled in its effects upon the diseases incident to this organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all mucous film from the scleroty coat without the use of instruments. In fact, it works like a charm on the Eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.

Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and if I do not give them relief in a short time, I WILL NOT CHARGE THEM ANYTHING. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco. 22-v12

A Rare Chance!

A Splendid Business in Alameda County.

FOR SALE AT A GREAT BARGAIN,

400 ACRES OF LAND,

INCLUDING

Landing, Wharf, Three Capacious Warehouses,

Capable of holding 12,000 Tons, which amount of grain was stored and shipped the past year. Connected with said business there is an extensive **Lumber Yard**; sales during last year, two million feet, which sales, and the entire business, can be largely increased.

The above is a rare opportunity for parties desirous of engaging in an active business that will pay a large dividend on the investment. Satisfactory reasons given for selling, and all information desired can be obtained on application by mail, or otherwise, to

G. F. SMITH,
Notary Public and Searcher of Records, Office "Deatty House," San Leandro. 23v12-m

SPLENDID

HOMESTEADS!

IN THE COUNTRY.

Twenty-Two Acre Blocks

Adjoining the beautiful Town of

San Leandro, Harlan's Addition

DUT ONE HOUR'S RIDE FROM SAN FRANCISCO.

Property but a few rods from the Railroad Depot. Good schools, good water, splendid view, free from wind and dust, and the best of soil.

☞ **Title—U. S. Patent.** ☜

A rare chance to buy a beautiful Homestead for your wife and little ones, at a low figure.

—ALSO—

Improved Homesteads and Farms of 20, 50 or 100 Acres,

In Alameda county. The most desirable locations in the State. Apply to or address

Notary Public and Searcher of Records.
Office, "Deaty House," (directly opposite the Court House,)
San Leandro. 19v12-3m

Occidental Homestead

ASSOCIATION,

Office, 305 Montgomery street, San Francisco.

Capital Stock : : : : : : : $33,600

102 Shares, $33 Each.

THIS ASSOCIATION was formed to enable its members to obtain desirable homestead lots in this city, at a cheap and easy rate, paying for the same by regular monthly installments. For this purpose they have purchased blocks 499, 500, and 501 in the Western Addition to this city, bounded by Devisadero, Pine, Broderick and Clay streets. Subscribers will pay an initiation fee of $5 on each share taken, to form a fund for defraying current expenses, and $11 per month for thirty months, commencing in April, 1866. The property is within three blocks of the Turk Street Railroad, is nearly all on the grade, and is most desirably located for homestead purposes. It is directly east from the lands of the California Homestead Association. The property has been purchased on very reasonable terms, and offers a rare opportunity for investment. A number of fine houses are in process of erection, and streets are being graded near this property, which will greatly increase its value.

When twelve monthly payments have been made, the property will be divided among the members in the usual manner, and each shareholder will receive a contract for a deed to the lot or lots to which he may be entitled, and have the privilege of taking immediate possession of the same. The lots average 27 feet in front by 120 feet in depth. The whole amount due upon any lot may be paid at any time, and discount at the rate of 1½ per cent. per month will be deducted therefrom. Persons wishing to visit the lands of this Association will take the Turk street cars to Devisadero street, and theaca gn northerly along Devisadero to Pine street.

$20,000 of the capital stock is taken, and the banks are open for subscription to the balance, at the office of the Secretary, where the Official Map of the Association can be seen, and all particulars obtained.

The Title to this property is perfect.

J. S. LUTY, Secretary.

Office 305 Montgomery street, corner of Pine, Rooms 2 and 6. 20v12-tf

Mining Summary.

CALIFORNIA.

Alpine County—

The Silver Mountain *Bulletin*, of June 9th, has the following items: The Illinois California Company in Raymond district, ars in with their 'big tunnel' 280 feet....Ths General Grant Company are in about 325 feet. Their prospects are very flattering....Ths Kohinoor, parallel with the George Washington, is to have n few tons of the croppings worked. The claim is on ths top of the mountain, southwest of the town, and is 2,000 feet above it....The drones in the county are to be made to 'toe the mark,' and develop their claims, or be sold out....The Pennsylvania Company are now cutting across their ledge, in order to determins its thickuess and quality. They are in it over twelve feet, with no indications of the back woll....The difference of opinion regarding ths southern houndary of Buckeye No. 1 and the locators of the South Buckeye, will be amicahly adjusted. Also ths conflict between the locators of the Ophir and South Buckeye....The thirteen tons of rock of the Balaclava claim yielded a trifle over twelve dollars per ton. Had the ore been assorted, the yield would have reached over thirty dollars per ton....There is a report current on the streets that a twenty-stamp mill will be brought in from Gold Hill, and put up in Pennsylvania Cañon within sixty days. ....Buckeye No. 2 is timbering up....B. Pilkington is expected from New York in season to commence operations on the Buckeye No. 1 by July 15th....The Lady Franklin is going to sink on the ledge. It is thought they will reach the pay ore within fifty fset.

Amador County—

From the *Ledger* of June 23d, we glsan the following: The Railroad mine, at Sutter Creek, is steadily improving, both as to the richness of the rock and the width of the vein as they go down. They are now down over two hundred feet, and have a two foot ledge of rich quartz....The shaft on the Golden Gate mine is now 160 feet in depth. The lode retains its full size, and since the introduction of the Prater & Hendy concentrators, is yielding better than ever.

The *Dispatch* of same date, has these items: Capt. J. W. Miller has struck a vein of rich copper ore in the Phœnix. The specimens of ore taken out are said to look as well as those from the Newton or Ione City claims....Ths Butte Ditch Water Company hnd a clean up in their mining claim on Tunnel Hill, nenr Jackson, this week, and realized very good pny for their labor. They have been at work about three months.

A correspondent of same, from Mokelumne Hill, says: Since my last letter there has been some excitement in this vicinity in regard to quartz and other mining operntions. I learn that parties have recently taken up claims near the Golden Gate ranch. Work will be commenced upon some of them immediately.

Calaveras County—

The Copperopolis *Courier*, of June 23d, has the following items: Preparations are making to resume work on the quartz claim of Rathjib & Co., at Lower Calaveritas....Work will soon he resumed on the Fair Play, near San Domingo, in this county....The Telegraph Company's mill, in Chili Gulch, caught fire oue day last week, and was not extinguished until considerable damage had been done to the machinery.

The *Register* says: B. K. Thorn showed us recently five dollars and a half in gold dust, which be obtained from two and a half pounds of quartz, taken from a lead lately discovered at Rich Gulch, nenr the Mokelumne river.

Correspondent of same, at Murphy's, says: The German Ridge Copper Mining Company expect to reach their vein of copper in a few days....The workiuen on the Fair Play have recently struck ore and taken out several tons of rich rock, most of which will pay from four to eight hundred dollars per ton....The Washington continues to pay well with an arastra, the rock being richer and tho vein wider the deeper they get.

The *Chronicle* says: We were shown this week, by Mr. Weil of our town, some of the richest dirt, taken from a claim in old Rich Gulch, in which he is a partner, which we have ever seen in California. A pound and a quarter of the dirt, after being crushed in a mortar, yielded twenty dollars. The vein is five feet in width, and this is said to be a fair sample of the entire vein....From all portions of the county we are in receipt of the most cheering news, and scarcely a day passes without new discoveries being made. At West Point a large number of mills are in successful operation. From the southsrn portion of the county, the intelligence is equally flattering. Mines which have lain idle for years, are now being successfully worked, and new developments are of almost daily occurrence.

Humboldt County—

The *Times* of the 16th inst., says: We learn that two gentlemen from Arcata, while out hunting the other day, discovered another coal mine near Boulder Creek....We learn that the Erwin Davis well is down to the depth of nine hundred and twenty-five feet.

Mariposa County—

The *Gazette*, of the 23d, says: Mining on the Grant is rather on the decline. Ths vein near Mariposn is not worked, and the work on ths Princeton vein has ceased for the present. There is quite a lively time at the Bear Valley mines, but nothing worthy of speciul comment. At Huntsr's Valley, mining is unusually dull. The La Victoire is doiug something, but most others are waiting.

Nevada County—

The *Gazette*, of June 23d, says: The work on the quartz mill of Young & Black, at Eureka, is progressing rapidly, and the mill will be in running order in a few weeks. They havs out two or thres hundred tons of rock, which it is calculated will keep the mill employed until the tunnel is completed.

The Grass Valley *National* has the following: The Eagle Company has commenced operations by starting a tunnel for the Grizzly ledge, which will strike it in about a hundred feet.

The Pioneer Company, at Sshastopol, has resumed work in their tunnel.

Excelsior.—The Meadow Lake *Sun* understands that arrangements have been made by the owners of the Shooting Star ledge, on Old Man mountain, with a San Francisco firm, to erect a twenty-stamp mill near their ledge, as soon as the machinery for that purpose can be had on the premises.

The Pacific Ledge, says a writer in the *Sun*, "has three claims located upon it,—the Pacific, the Confidence, and the Berlin. Assays of Confidence rock have shown from $62 to $400 to the ton. The company is sinking an incline shaft, 17 feet 7, in the clear. It follows the dip of the ledge and embraces its entire width. Hoisting works and a mill will be erected during the present season if the prospects shall warrant the expense. On the Pacific Company's ground a shaft of the same dimensions has been commenced, but was discontinued on account of the water. The Berlin Company have done little beyond the work required by law to hold ths claim."

Placer County—

The *Herald*, of June 23d, says: We saw six hundred pounds of half concentrated sulphurets, at Newcastle the other day, the product of ten tons of crushed rock from the Pacific lead, located in that vicinity. An assay by Kellogg, Hewston & Co., of San Francisco, of the same sulphurets, was shown us, that went over $600 to the ton, principally gold. The sulphurets were about being shipped to San Francisco, to Swansea agents.

The shaft on the Pacific ledgs is now down sixty feet, and the ledge improves in width and quality of rock."

A ledge rich in silver and gold, says the *Stars and Stripes*, was disclosed to view a few days since, by a blast in a cut of the railroad, about thirteen miles above Dutch Flat.

Plumas County—

Ths Quincy *Union*, of the 16th inst., has these items: Bidwell's mill, in Dixie Cañon, recently crushed fifty tons of rock from the Green Mountain quartz ledge, in Cherokee district, near Round Valley, owned by Bachelder & Co., which averaged $40 per ton.... There is a great scarcity of hands to work the quartz mines in the county....The mines in Black Hawk ravine are paying well. Larrison & Co. took out for a two weeks' run, over $1,300....Wentworth & Truck's quartz mill, in Indian Valley, commenced running again last wesk. They are getting out some rich quartz from their ledge....All of the companies at Twslvs Mile Bar are doing well. Droge & Kiser have taken out $2,700 during the last three months....The miuers at Hungarian Hill are all busy at work, with very good prospects for the season. Kelley & Co. have just cleaned one of their sluices, after three weeks' run, and obtained over $700....J. B. McGee, of the Mammoth mills, is getting out some very rich rock from the Mammoth ledge.

Sacramento County—

The Folsom *Telegraph*, of the 23d inst., says: The engine and machinery for a new quartz mill, for the Jersey Blue claim, at White Rock, belonging to Messrs. Palmer & Day, of this place, arrived a few days since, and will be erected immediately. These gentlemen have over four hundred tons of rock ready for crushing, which it is believed will average over fifty dollars per ton....E. G. Winchell, Esq., of Mormon Tavern, and two other men, are the owners of a quartz ledge near Clarksville, about seven miles from this place, which assays over two hundred dollars per ton. The ledge is well defined, is twelve inches wide and is gradually growing wider; the shaft is sunk fifty feet, and they have been crushing rock with an arastra for the past two weeks, and do not intend to clean up until the 4th of July—when they intend to celebrate their good luck.

Shasta County—

The *Courier* says that the sulphuret specimen which recently assayed $600 to the ton, in San Francisco, was from the Potosi lode, at Muletown. The copper ore specimen which accompanied it, and which is spoken of as very fine, was from the Copper Creek discovery, near Trinity Centre....The miners at South Forks have amended the laws of the district so that any one can hold his claim by renewing his notice every ten days—or by working it—as he may elect.

Sierra County—

From the *Mountain Messenger*, of the 23d June, we clip the following: We have been informed that within the past few days some half dozen new locations have been made in Hog Cañon. Specimens of the rock shown us are reported to assay well....When the repairs on the Wheeler mill shall have been completed, we understand it is ths intention of the company to run it as a custom or prospecting mill, for the purpose of giving the locators of the numerous ledges in this vicinity a chance of determining whether their rock will pay or not....Efforts ars beiug made by parties in this place to form an association for the purpose of discovering, locating and prospecting quartz ledges in this vicinity. The plan is to secure money enough by subscription to keep a gang of competent miners at the work of prospecting, each subscriber to share in ths locations made in proportion to the sum contributed....The Union claim, at Alleghany, cleaned up $4,000 after a short run....We have been shown some exceedingly rich rock taken from the Sailor company's ledge, on the hill side just above town. A tunnel has been run in on the ledge, which has every appearance of being extensive as well as rich. The company ars refitting the Wheeler quartz mill, and will commence crushing in about two weeks....Mr. Riggs of this place, who has been at Alleghanytown testing his process of reducing quartz by desulphurization, returned last week. He seems to have been successful, having tried rock from the Twenty-One and Oak Flat companies....The Twenty-One company have got their hurdy-gurdy wheel in operation. It works splendidly, and gives a sufficiency of power far beyond the capacity of the present mill machinery. The company were expected to commence crushing this week....The Oak Flat company have started their old mill again, but do not pan up, intending to work their sulphurets by the new process or send them below for treatment. The rock they are now getting is rich in fine gold, and it is thought no further nssessment need be levied. They have a large quantity of mill rock ready for crushing....We were at the Union mill, which was running on rich looking rock.

Siskiyou County—

Correspondence of the Yreka *Union* says: The claims at Oro Fino are paying well.... Wright & Co. are taking out large pay. Hollenback, of Mugginsville, washed up some $2,000 last week....John Carroll, of French Gulch, is getting big pay....Harper & Co., of Indian Creek, are doing well....The McAdams Creek claims bid fair to pay well this season.

Trinity County—

The *Journal*, of June 23d, says: The persistence and good fortune of Reed, Griffith, Van Matre and others, in the Buckeye scction, is attracting attention to that locality. As a general thing, more prospecting than usual is being dons this season. Men are daily arriving on New River and its tributaries, and the prospect of a large population this summer is certain.

Tulare County—

The Visalia *Delta*, of June 21st, has these items: Mr. J. L. Carter, at White River, has a first-class quartz mill nearly completed nbout three and and a half miles below White River station....The old Water mill, at White River, is taking out about $1,000 per each seventy hours run....Mr. Fleck has a small water power, half a mile below town, working a good crusher and several arastras....Nudnut & Ovens have a water power half a mile below Carter's mill, with which they crush about two tons per day with arastras.

Letter from Havilah to same, says: Mining progresses famously in this and all the surrounding districts. Within the last two weeks six valuable lodes have been discovered in the districts of Clear Creek, Mt. Sinai and Pi-Ute, and two hundred and forty men have come into the three.

The editorial Correspondence of the Mariposa *Free Press*, speaking of Long Tom mine, says: The company have erected a neat 10-stamp mill, have run about seventy days, and taken out already more than enough to pay the purchase money, cost of machinery and expenses of working.

Tuolumne County—

The *Courier* of the 23d has these items:—The Mount Vernon Claim, owned by Messrs. Pitts, Mandeville & Co., yielded last Saturday, as proceeds from one week's crushing in the Monitor mill, the sum of 121½ ounces.... The Deer Creek Claim is paying remarkably well....Last week the Grizzly mill had a run of four days, and cleaned up $1,500. This week the same institutions produced, as the result of six days crushing, the respectable sum of $3,500....Waters & Co.'s mill, near Tuttletown, will commence work again next week. ....Ths new 15-stamp mill of the Sonorn company will commence running next week. The company have 1,560 tons nf quartz on hand ready for crushing.

Yuba County—

Gen Rosecrans and party on Monday, says the Marysville *Appeal*, visited the mines at Brown's Valley. They inspected ths Jefferson, the Pennsylvania and the Dannebroge mills. A grand dinner followed. A bouquet was presented to ths General by the ladies of Brown's Valley. Speeches were made, toasts were drank, and the village school, in a body, marched in, and sang the "Star Spangled Banner." Altogether it was a great occasion.

NEVADA.

Washoe—

The *Enterprise* says the Gould & Curry mill, for the month of May, crushed and amalgamated 3,600 tons of rock, which worked within 11 per cent. of assays. This, we believe, is the largest amount of rock that has ever been worked at this mill for any one month.

Reese River.—

The *Reveille*, of June 16th, has these items: Four certificates of the assay of ores by J. R. Murphy, of the National Bank assay office, have just been laid upon our table. Hudson, $1,058.76 of silver per ton; Holland, $994.36; One Thousand Fine, $4,184.77; Newark, $820. Ths veins from which thess ores were obtained are situated between the Midas mill and the Fernando Wood mine of the Roman Brothers Company....We were shown to-day the certified assay of mineral procnred from the Esperanza ledge, in the Clarendon district, about one hundred and fifty miles southwest of Austin, which yielded at the rate of $711.59 of silver to the ton....The grading for the foundation of a new mill at Kingston, has been nearly completed for the New England and Nevada Consolidated Silver Mining Company. This company purchased the works of the Colfax mill, which they removed and expect to have in running order in 90 days.....The Monte Christo company are to erect a first-class mill forthwith.

The Nye County *News* of the 16th says:—The celebrated Alvarez claims are to be sold by the Sheriff. These mines are undoubtedly the richest in ths country, and in energetic hands can be made to yield vast quantities of bullion. Seventy-five thousnnd dollars was offered last fall for the Santa Elena mine alone. ....The new Knickerbocker mill has started.

Esmeralda—

The *Union* of the 6th has the following:—Seventeen hundred pounds of ore brougbt in by Dr. Fitzhugh and A. J. Rhodes from a new district called the Pahdet, and worked at the Del Monte mill, yielded $103....The Oro Fino company, organized in New York one year since, has a mill at Chrysopolis Point, near Kearsnrge, which will commence running in ten days....At Kearsarge, Paul's mill is running on ore that I learn is paying two hundred dollars per ton, and at Fish Springs they are working free gold ore that pays from $60 to $170 per ton.

Humboldt—

The Reese River *Reveille* gives a description of the Monroe Mine, which we condense: The pay streak varies from six inches to twenty inches in width. The entire body of ore contains gold, much of it paying by mill process five hundred dollars per ton, while the second class has all paid upwards of one hundred dollars per ton. Should it be put through a desulphurizing process it would pay much more. Quite a large quantity of ths ore has been reduced at Hoyt's mill on the Humbolt river, distant twenty miles from the mine, the total expense of hauling and crushing being but thirty-two dollars per ton. As there is no waste rock in the ledge, the Monroe must be considered one of the most valuable gold-bearing mines known on the Pacific coast.

IDAHO.

The Marysville *Express* of June 23d, says: A party with a quartz mill for South Boise left Chico last Tuesday. The party was a "jolly" one. They party took their families with them, together with all the appliances necessary to make the trip a comfortable one—not excepting shooting implements and fishing tackle.

The *Statesman* says:—A reliable gentleman of Owyhee, just returned from New York, took some pains to inquire into the truth of the diamond story that Lyon told about the diamonds when he came out here last fall, and he found it to be false in every particular.... Harrison and Benson mills are now running and crushing rich quartz from many ledges in the vicinity of Rocky Bar.

ARIZONA.

The Reese River *Reville*, of June 7th, says: William T. Grant, a pioneer of Austin, who reached the capital of Arizona, via Pahrana-

gat, has just written a letter from Prescott to a friend in Austin, from which we have extracted several interesting notes. * * "Very little prospecting is being done for new lodes, as the Indians are trouble-some, and the miners generally are contented with what they have. I dont rely much on their judgment of quartz, as they are mostly from Colorado and the sheep ranches of California; there are, however, a few miners from Esmeralda, in Nevada, who have had varied experience in quartz, who express their satisfaction with the prospects of the country. * * Swilling's party, about sixty strong, and well armed and mounted, will start on the 20th instant for the White Mountains, about 250 miles to the eastward. He claims to have been there and worked, and to have taken out gold as high as $50 to the pan, but that the Apaches broke up his camp and drove him off. Everybody seems to confide in his story, and we all believe he will lead the party to good diggings."

MONTANA.

The *Post* of June 9th has the following items: We to-day saw, in the hands of Sam. Holman, a lump of silver weighing one ounce, which was taken from two pounds of the quartz of the Alameda lode. The experience of every day demonstrates more fully the surpassing richness of the gold and silver mines in this immediate vicinity....It five hundred of the men who are loafing round Helena and parts adjacent, would come to Virginia, they could find employment at good wages, in this district without delay. Ordinary hands get $5; bedrock men, $6 to $7, and drifters from $9 to $11, with scarcely any to be had for love or money....The mill at Hot Springs is now ready to commence running....John H. Rogers is once more located in the capital. He is charged with the erection of a 20-stamp mill in French Gulch, Summit district. The building to contain the machinery is to be of stone, and the quartz to be reduced is to be taken from the John How lode. The mill is now at Becton, and will be on the ground as soon as the building is prepared for its reception, if not sooner....Machinery is to be set up on the lodes of the Edgerton company, at once.

Silver Bow correspondent of same paper, says: The placer claims, in the vicinity, are yielding largely; and I hear of one from which, out of one pan of dirt, $60 was obtained. The Silver Bow mining district is not only confined to placer diggings, but has some of the finest quartz ledges that I ever saw; and among them is the Brady ledge. This ledge has a shaft sunk to the depth of forty-five feet, and has a crevice which, at the bottom of the shaft, is about nine feet wide. The rock is both silver and gold bearing. Another good ledge in this district is the Mauritius, owned by Mr. Wm. E. Harris. The rock from this lode is very rich in silver; the crevice is near the surface, about four feet in width, and is well defined.

Helena letter of same says: On the 1st inst., John Bristol cleaned up from a ten hours' run, with four hands, on a bar claim at No 2 below Discovery, in White's Gulch, $1,265; a nugget, almost perfectly round and free from quartz, weighing the odd $265.

Big Indian, Holmes Gulch, and Dry Gulch, are yielding finely in the most tempting looking dust....A miner's wife on Short creek, went out prospecting alone one afternoon, and struck a rich lead of dirt. She took out $300 with a pan in an hour....A nugget of gold was found on Indian creek, weighing $870.

COLORADO.

From the *Journal* of June 5th, we clip the following items: We learn that the DuBois brothers, who have for the last year been prospecting for silver in and around the foot of Long's Peak, have recently put up a smelting furnace in that district....Half a pound of quartz from the Vanderbilt yielded by fire assay the other day, one dollar....The Black Hawk company retorted for the week's run, twenty pounds and a half, worth $5,000.... Four cords of average Bobtail ore, cleaned up and retorted ninety-eight ounces of gold, as the result of their last week's run—worth in currency about $2,000. Owing to a lack of ore, the Holbrook mill has lain idle during the past week. The superintendent informs us that the mine is improving, the crevice gradually widening as they sink on it....The Tennessee tunnel is to be repaired and work resumed in earnest....A prospect was taken yesterday by Mr. Jno. Bennett from two pounds of *iron* from the Missouri City lode, at a depth of ninety-eight feet. Mr. B. obtained fifty-two cents as the result. The shaft is just coming out of the gap, and the ore now obtained is of the first quality of iron. Preparations are now making to take it out in large quantities and have it crushed in one of the old water mills in Missouri City.

The *Register* has these items: Hon. J. T. Lynch has raised fifty thousand dollars working capital for the purpose of developing the Suky lode near Montgomery, Snake river....In a recent run from the ores taken from Sensenderfer's claim on the Bobtail, twenty per cent. by weight of the bullion taken out was shown by assay to be silver....The Congress gold mining company, in Russel Gulch, are working claim No. 1, on the Saratoga lode. They have a 145-foot shaft sunk down to good ore, and feel considerably elated at the prospects ahead....The Noble gold mining company's new 10 stamp mill was started up day before yesterday....Mr. Cheeny, of Lake Gulch, the only man who has not sold out his mill since he brought it to the Territory, will start up again to-morrow.

UTAH.

The *Vedette* of June 14th, says: Probably not less than one hundred thousand dollars' worth of machinery will be in Rush Valley this season, and an equal if not larger amount in Pahranagat—enough to fully test and prove the value of these mines.

The ledges in Rush Valley, Pahranagat and other mining districts in the Territory, *will be fully tested*. The men owning them will erect smelting works and prove whether there is silver enough in them to pay for working at present rates of labor and transportation. The Argenta company, over whose suspension the polygamists rejoice greatly, has never to our knowledge smelted one pound of ore.

Cannel Coal in the United States of Colombia.

Mr. May, an English engineer in the employ of the Colombia government, S. A., in his report published in the official journals of that Republic on October 31st, 1865, gives an account of the discovery in the province of Rio Hacha, of immense deposits of coal "of the variety called cannel;" and proposes that a railroad forty-two miles long, from the mines to the sea be constructed, in order to make the new discovery available. In the course of the report, he gives a very complete description of this species of coal, which we quote from the London *Colliery Guardian* of March 24th:

"Cannel coal is known in mineralogy as a black mineral having usually a slight tinge of grey; its texture is compact, and its fracture even or conchoidal with large cavities; its luster is resinous and glistening; it is sufficiently solid and hard to be cut and polished, and is the least brittle variety of coal. Its specific gravity varies from 1.23 to 1.27. It contains, according to Kirwan, carbon 75.2, bitumen 21.68, hydrogen 21.6, nitrogen 13.7. It burns without softening, with a large bright flame of short duration, leaving a sooty substance; and when the combustion is complete, there is an earthy residue of at least three per cent. Its heating power is the same as coke. Its odor, like that of jet, is not unpleasant. When placed on the fire, it often decrepitates and breaks into angular fragments. It is found in England at Wigan and Whitehaven, also at Gilmeston, in Scotland; there is also said to be a mine at Cape Breton, and a few others of little importance in the United States. It is employed, like jet, for making inkholders, toys, etc. When of fine quality it does not soil the fingers, and it ignites and burns like a candle. It is used in England and the United States for fuel in the houses of wealthy people, either alone or mixed with other coal. It is the best coal known for making gas, and would be universally employed for that purpose, and for the extraction of kerosine, which it yields in abundance, but for its scarcity and high price. It is peculiarly suitable for heating the boilers of locomotives, and all other classes of steam engines, on account of its burning with a free flame. After engineers have done all they can, and have exhausted their skill and ingenuity to perfect the machinery of steamboats, the substitution of cannel for the ordinary fuels employed will give from twenty to twenty-five per cent. more velocity to a vessel. The weight and quantity of cannel coal required to produce a given effect are much less than when ordinary coal is burned; and all the American steamboats whenever high speed is required, use this coal either alone or mixed with other combustibles."

Who Discovered Gold.—Cadmus is said to be the first who discovered gold. Some authors attribute its discovery to Thoas of Thrace; others to Mereury, son of Jupiter; others to Pisus, King of Italy, who having left his country, went to Egypt, where he was chosen king after the death of Mizraim, and received the surname of God of Gold, on account of his discovery. Others say that Eaclis or Cœeus, son of Jupiter, or Sol, son of Oceanus, was the first who discovered gold. Eschyles thinks that Prometheus not only discovered gold but also other metals.

The anti-cholera disinfecting fluid used at Naples, was said to be very effective. Its basis was permanganate of potassium, and which is, in fact, ozone. Its introduction and general appliance has been the work of some British residents, who procured a supply from London.

To some men it is indispensable to be worth money, for without it they would be worth nothing.

Rheumatism!!

READ IT! READ IT!!

Sacramento, April 16 h, 1866.

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITing I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial.

Yours truly, GEORGE TAYLOR.

☞ Richards' Remedy is for sale by
H. BOWMAN,
Druggist, Sacramento.
Price, $2 50 per Bottle. 20v12

The Great Pain Annihilator.

DR. E. R. JOHNSON WILL WARRANT TO CURE ALL cases of Asthma, Fever and Ague, Catarrh, Sore Throat, and Womb Diseases. The Doctor's success is miraculous in cases of RHEUMATISM, NEURALGIA, CONSUMPTION, GOUT, PARALYSIS, INFLAMMATION OF THE EYES, and all other diseases that human skill can reach. Rheumatic Pains removed in five minutes. Some of the afflicted that visit him come from one to six hundred miles, and soon find relief. Persons at a distance can be cured at home by addressing a letter to Dr. Johnson, No. 700 Market Street, San Francisco, stating case, symptoms, length of time the disease has continued, and have medicine promptly forwarded to any part of the country, with full and plain directions. ☞Consultation by letter or otherwise, free. 16v12-1m

Commercial Academy for Ladies & Gentlemen,

No. 111 K STREET, SACRAMENTO, CALIFORNIA. Established in 1853, where students can acquire a thorough business education. Double Entry Book Keeping, Practical and Ornamental Penmanship and Drawing, Latin, French, the Common and Higher English Branches, taught on reasonable terms. Students from any part of the State can procure board and lodging in private families, near the Academy, at from $4 to $6 per week. For terms, address, MART TAYLOR, Principal; Miss SARAH J. WEIR, Associate Principal. 20v12

San Francisco:

Saturday Morning, June 30, 1866.

Commence with the New Volume.

Next week commences Volume Thirteen of the MINING AND SCIENTIFIC PRESS. We intend to make it better than any of its predecessors. Subscribe at once, and thus assist us in the undertaking.

A LOSS TO THE SCIENTIFIC WORLD.—The Academy of Science, at Chicago, was burned on the 19th instant, and about one-half its valuable collection destroyed. The loss by this fire will be seriously felt by the scientific world. This institution had been some ten years making its collection in natural history, mineralogy, etc., and had brought it to a point which placed it in rank only second to that of the Smithsonian Institute at Washington. The museum contained specimens gathered from every part of the known world, some of which cannot readily be replaced. By reference to our last week's issue, it will be observed that the California Academy of Natural Sciences have adopted a series of resolutions, sympathizing with the friends of science in our sister city in their late loss.

THE MECHANICS' INSTITUTE.—The contract for the new building of this association has been awarded to James J. Doyle, who is to have the same entirely finished and upholstered on the 2d day of December next, for the sum of $42,000. The specification papers were drawn by the architect, Wm. Patton. We believe the building is to be three stories in hight, 75 feet front on Post street, the west line running 107 feet deep towards Market street, and the east line 83 feet.

The old buildings of the Institute, on California street, have been sold to the proprietors of the *Alta California*, for the sum of $25,500. They will remove their library in a few days to No. 636 Market street, between Montgomery and Kearney streets, where the business of the Institute will be transacted until the new building is completed.

PHANTOM PHOTOGRAPHS.—Messrs. Bradley & Rulofson, photographers of this city, have succeeded in perfecting phantom photographs, a very pleasing invention lately introduced at the East for parlor amusement. This new philosophic toy has become very popular, and will doubtless soon be generally introduced into this city. The familiar experiments of the laboratory have, at the present time, a great tendency to become the magic amusements of the drawing room; and perhaps no prettier illusion than the phantom photograph has yet been devised.

FLUID FOR LOOSENING BOILER SCALE.—McKee's Boiler Fluid, for loosening the scale from boilers, is now being introduced for use in this State. This material operates both as a preventive against the forming of "scale," and as a medium for removing it when it has formed. Great excellence and much superiority is claimed for it. It is also claimed that where scale has already formed, it will become loosened, so as to be easily removed in the space of two or three weeks. Testimonials with regard to its efficacy, and full instructions for using it, may be obtained on application to Capt. C. H. Harrison, 517 Front street, sole agent for California.

THE INDEX to volume XII appears to-day, necessarily to the exclusion of more unimportant and less expensive reading matter.

KAOLIN, AND OTHER FIRE CLAYS.

We last week noticed the fact of having received some samples of kaolin from Mr. A. D. Brown, of Virginia City. These samples were prepared from a deposit, recently discovered by Mr. Brown, about three miles distant from that city, and which is said to be seven feet in thickness. W. T. Rickard, an assayer of Virginia City, says he finds, after a careful examination of the mineral, that with a proper admixture of silica it produces a fire brick of a most refractory character, equal, so far as tried, to the best Stowbridge article imported from England, and now selling in Virginia City at sixty cents each. Mr. Rickard also states that when made into crucibles it resists the action of fire, and fluxes as well as the French crucibles, worth now in that city from 20 to 30 cents each. He furthermore expresses the opinion that with the cheapness with which it can be prepared for the market, it can be profitably made into pottery, and used for other purposes in the arts. Mr. Brown informs us that he shall soon commence the manufacture of fire brick.

We have little doubt from the samples sent, and the result of Mr. Rickard's investigations, that this discovery will prove of much value for the manufacture of fire brick and common articles of pottery, in that vicinity, on account of the great cost of freight over the mountains; but for any other purpose, the high price of labor and the limited demand for the products, will hardly allow of the manufacture being made profitable.

We regret that our correspondent did not send us a small sample of the article in its crude state, so that we could have compared it with the kaolin from Sonoma Valley. We infer from Mr. Rickard's certificate that he is obliged to *add his silica* to the crude kaolin, in order to obtain his silicate. The deposit at Sonoma contains quite as large a percentage of silica as is required for the manufacture of either fire brick or crucibles, and, to all appearances, (we are not aware that it has ever been subjected to analysis), is equal to anything which can be found in any part of the world. We have a sample in our cabinet which, in its natural state, judging from the eye alone, is superior to the prepared article sent us from Washoe, and we understand it occurs in inexhaustible quantities, within a few miles of steam navigation with this city. It is a matter of no little surprise that some enterprising capitalists have not ere this endeavored to turn it to some profitable account.

All clays, as they occur in nature, are essentially hydrated silicates of alumina. Their value as fire clays, in the manufacture of pottery, crucibles, fire brick, etc., depends upon their elementary composition, which is always extremely variable. In the same location, often in the same pit and the same specimen, even, great variations are found. In the sample referred to from Sonoma, one portion is as soft as chalk, while another is quite hard and unyielding; accordingly the formulæ which have been employed to express the constitution of fire clays are quite discordant. We give several examples:

The clay used for crucibles in which cast steel is melted at St. Etienne, contains 58.75 silica; 25.10 alumina; 2.51 magnesia; 2.50 sesquioxide of iron; 11.05 water; with traces of lime.

The Stowbridge clay, used for crucibles, 63.30 Si.; 23.30 Al.; 1.80 iron; 10.30 water, with traces of lime.

The finest China clay or kaolin in Europe is found in Cornwall, an analysis of which is given as follows: 46.32 Si.; 39.84 Al.; .36 lime; .44 manganese; .27 water of combination; 12.08 hygroscopic water.

The plasticity of clays depends upon their water of combination; when they have once parted with that they can be no longer molded into vessels. All clays contain also hygroscopic water, which they part with at 100° centigrade, and the loss of which does not affect their plasticity. If we take a piece of clay and dry it in the sun or in an oven heated to 100° centigrade, until it has lost all its hygroscopic water (that which it is capable of absorbing from the atmosphere), and then pound it up, we can, by applying more water, again mold it; but if we heat it to redness, we thereby drive off its water of combination, and it cannot again be made plastic. It will absorb water, but not the least degree of plasticity will appear. Pounded brick, or pottery, for instance, can never be molded. In the manufacture of crucibles, a portion of the material used must be burned clay, or old crucibles, pounded up. This material, mixed with about two-thirds its bulk of raw or unburned clay, is rendered sufficiently plastic for the purpose. The presence of a portion of unburned clay is required to prevent them from cracking when exposed to the high heat of the furnace. The presence of iron pyrites is a fatal objection to the use of any clay for crucibles. The pyrites are readily decomposed by the gases in the furnace, leaving the crucibles porous, and of course useless.

The quality of a fire clay in reference to its fitness for crucibles or fire brick, may be quite satisfactorily tested by thoroughly kneading a small quantity and molding it into such a shape as will present sharp edges. These pieces, when thoroughly dry, should be inclosed in a covered crucible and submitted to a high heat in a blast furnace. If the edges continue sharp and unchanged, the material may be considered good; but if they are much rounded, that may be looked upon as an evidence of incipient fusion; if they are melted, the clay is, of course, worthless. With a little practice, experiments in this manner may be made very satisfactory and reliable. Never build a furnace of untried material. The non-observance of this simple precaution has cost thousands of dollars in California.

SULPHURETS IN GRAVEL DIGGINGS.—A paragraph is going the rounds of the press to the effect that a wonderful amount of gold is being run off in the "sulphurets" from the cement diggings about You Bet, Little York, and other places. The paragraph assumes that enough gold can be obtained from this source to pay for the working of the mines and mills, thus making what are now the gross proceeds of the mines a clear gain to the owners. It is furthermore said that offers of from $50 to $100 per day have been made for these sulphurets. We chanced to be a traveling companion of "the gentleman from San Francisco," who "visited the mines and mills," and who, after causing some experiments to be undertaken, is supposed to have made such liberal offers. We have very good reason for believing that he never did any such foolish thing, and never dreamed from his experiments that the mills can be made to pay expenses from the sulphurets which can be saved. That some free gold is lost by imperfect saving apparatus, and a considerable carried away in the sulphurets, is undoubtedly true; but that there is anything like the loss above described is utter nonsense. If our cotemporaries will write $20 instead of $100, they will be much nearer the mark.

EXCELSIOR STOCK AND EXCHANGE BOARD.—This Board, for the sale and purchase of mining stocks in Excelsior District, Meadow Lake, was organized May 1st, 1866, with twenty-five charter members. A. C. Wightman, Esq., was elected President, and F. F. Patterson, Vice President. On their list of stocks appear 215 companies, all located within the district. They have a large, fine hall, 36 by 52 feet, fitted up in handsome style, with all necessary furniture. The doors are open to the public, and on every night of meeting the hall is crowded with spectators, anxious to witness the progress of sales. At present sales are dull, but few of the stocks being in demand. The California Mill and Mine is the most steady, selling from $90 to $105 per share. If the developments of the summer are favorable, the Board will have lively times, as they represent most every mine in the district. W.

HOWELL'S STEAM BOILER.—In our illustrated description of this boiler given in the issue of May 19, 1866, we unintentionally omitted to give the address of the inventor, which omission is here supplied: "D. C. Howell, Goshen, N. H."

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

MR. WM. R. GALLAGHER, Superintendent of the Crockett mine, near Aurora, sends us a fine specimen of ore from that lode. The ore shows considerable free gold; but of a very low grade on account of the presence of a large percentage of silver. It is also rich in sulphurets, and of a dark gray color from their partial decomposition.

DR. LANSZWEERT, of this city, has also sent us a fine specimen of Kaolin from Sonoma, in this State. The deposit from which this was taken is practically inexhaustible, and the quality of the article very superior. It is as white and clear as the finest plaster of Paris. This deposit, as well as that at Virginia City, is elsewhere noticed at length, in our columns of to-day.

BADLY INFORMED.—Mr. Gladstone, in his late annual financial statement, made on the 3d of May last to the British Parliament, made the following reference to the coal product of the United States, as reported in the English papers:

"There is another country not only as rich in mineral wealth as ourselves, but with a coal surface thirty-seven times greater than the coal surface of this country. I allude to the United States of America, and though *most of the coal there contains so large an amount of anthracite* that it is not fit for steam or for smelting purposes, yet to domestic purposes it is capable of being adapted."

It is surprisingly singular that a man of Mr. Gladstone's position in the world, should exhibit such an utter ignorance on a matter of such general notoriety and importance as the coal product of the United States. It is surprising in the first place that he should be ignorant of the fact that the very best coal in the world for making steam or producing iron—the two chief uses for coal—is anthracite; and in the second place it is still more surprising that he should exhibit such utter ignorance of the character of the vast coal deposit of the United States, as to suppose that our product was chiefly anthracite; when the fact is that out of the 146,000 square miles of our estimated coal area, we have only *forty-seven* square miles of anthracite beds. So far as "anthracite" being an objection, it is that very quality which places American coal so far ahead of English, for making iron and steam. If Mr. Gladstone will consult any English ironmaster on the subject, he will never make such a mistake again.

A NEW RAT TRAP is on exhibition at the What Cheer House, in this city, the invention of Mr. A. A. Fradenburg of Nevada. It is called a "Self-Setting Coercive Trap." It is set by winding up a spring. This spring half turns a door every time a rat nibbles at the bait, and "coerces" the victimized *rodent* into a box from which there is no escape. The trap is then again set and ready for the next victim. It is a very ingenious device, extremely simple, and to all appearances, most effective in its operation.

CALIFORNIA MATCH FACTORY.—This factory is located near the end of the Long Bridge, Potrero, and is driven by steam. W. D. Reed is superintendent. It is now manufacturing matches similar to the celebrated German matches, which burn quickly, give a good bright light, and have no smell. The general business, however, of this establishment is the manufacture of block matches.

TRIAL TRIP OF THE "S. M. WHIPPLE."—The opposition steamer S. M. Whipple was receiving her finishing touches yesterday, and takes her trial trip to-day. She steamed out to the "Point" last evening, her machinery working like a charm.

PETROLEUM LANDS.—The telegraph informs us that upon representation of Mr. Bidwell the Secretary of the Interior has revoked the order withdrawing from market the petroleum lands of California.

From San Bernardino County.—We are permitted to make the following extract from a private letter, dated San Beraardiao, Juan 19th, 1866:

"There is not much valuablo lnnd between hcre and Los Angeles, the valley or region of "El Montc" bcing the principal. This region lies quite low, but is sandy, and once cleared from the willows, with which it is mostly overgrowa, produces finely—particularly of corn. It would produce cotton, no doubt. This side of El Monte is the large runch of Cocomungo, consisting of three leagues of land. There is on this ranch a large vineyard and orchard, both of which could be extended indefinitely, if wanted, as the land is of a dry, gravelly aature, and lays beautifully for irrigation. But what is the nso to raise fruit or make wine when it costs all they ara worth to get them to market. Some day, when railroads pass through this region, it will come out of the kinks and take its place in the front, as a wine, olive and orange producing country. The valley of San Bernardino appears about as large as Napa, from Sebastopol to Suscol, and presents at this time one mass of green. It is nearly every foot of it susceptiblo of irrigation, and produces, of hay in particular, immensely. A man told me he was mowing the third crop, and would surely cut the piece twice more this season. His hay was alfulfa—and yet with all its green grass and shady trees, you are not satisfied with the appearance of things—as in Hogarth's pictures, the animal, the gross, seems to predominate; the country lacks character, soul!"

A New Kind of Fuel.—The Clevelaad (Ohio) *Herald* asserts that some of the lake steamboats are using fish for fuel! Huge 60-pound sturgeons are thrown bead foremost into the furnaces, with a little wood. The oil assists the combustion of the wood; and twenty stargeons are said to bo quite equal to a cord of wood in the production of heat.

Petroleum does aot seem to work well as a lubricator in a cotton mill. The Uaion Mills of Fall River have just had 6,000 cases of cottoa goods throwa back on their baads damaged by petroleum, used as a lubricator in their works. The most careful washing and bleaching has hitherto failed to remove the "spotting" effect of the petroleum oa the colors.

Cow Milker.—We saw Colvin's Americaa Cow Milker tested this week upoa a cow on the place of I. W. Kaox, Oaklaad. It proved its efficiency for milkiag, whea properly applied in good order. If it will stand the test of timo as well, it will certainly prove a valuable as well as novel instrumeat.

The third Heady's Improved Concentrator was shipped this week to the Ophir G. & S. M. Co.'s mill, near Newcastle, Placer county. It was ordered by Messrs. Weltry & Foster, who state that this concentrator is gaiaing in favor with millmea.

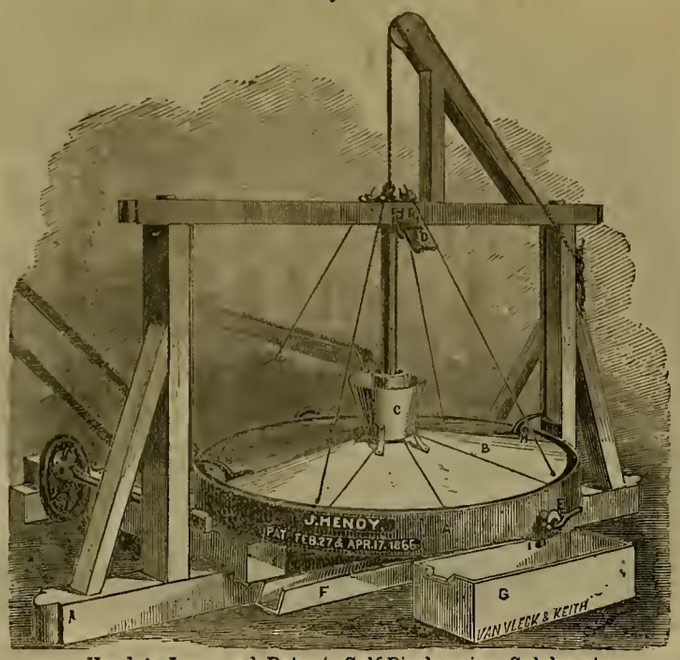
NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adopted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
OPHIR G. & S. M. CO., Newcastle, Placer County.
CONEY MILL, Jackson, Amador County.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:

One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Eight Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Dodge & Bro, San Francisco

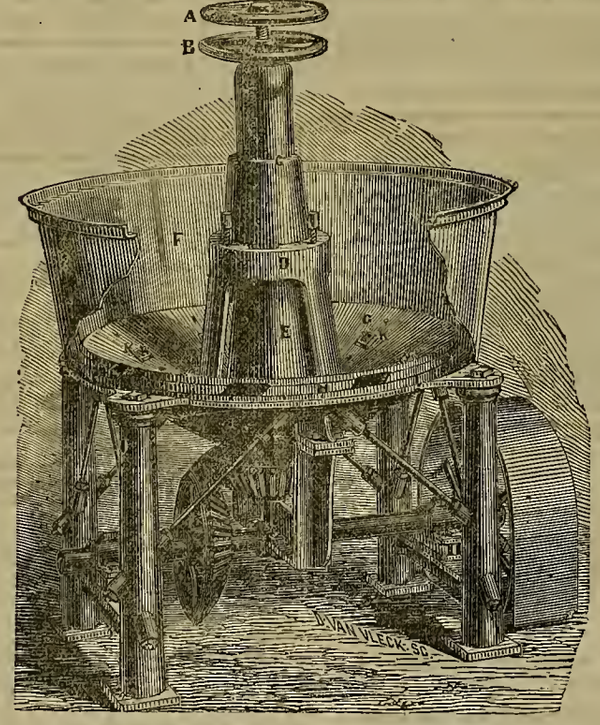
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

☞For explanation of the above engraving, and other particulars, send for a Circular.

JOSHUA HENDY,
8v12tf No. 402 Montgomery street, Room 3, 4th floor.

HEPBURN & PETERSON'S PANS AND SEPARATORS.

For Reducing and Amalgamating Gold and Silver Ores.



We invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of

Principal Mills Using them:

Names of Companies.	Location of Mill.	Names of Companies.	Location of Mill.
OOULD & CURRY	Virginia City, Nevada.	TEAKLE, ROGERS & CO	Nevada.
SILVER STATE REDUCT'N W'KS.	Empire City, "	MELVILLE KELSEY	Silver City, "
OPHIR	Washoe City, "	HUDGIN & FORMAN	Silver City, "
EDWARD McLEAN	Silver City, "	YELLOW JACKET	Empire City, "
SANTIAGO	Zepher Flat, "	BELDIN & GREGORY	Esmeralda, "
RAPHAEL & HUSTED	Gold Hill, "	HECKENDORN	Calaveras Co., Cal.
FRENCH & BESLER	Dayton, "	CARSON CREEK	Calaveras Co., "

RODGERS & GRISSAM	Silver City "	DON JUAN ROBINSON	Sonora, "
ANDERSON & SEAL	Washoe, "		

Manufactured at the Principal Foundries in San Francisco.

HEPBURN & PETERSON.

6v12tf At the VULCAN IRONWORKS, Nos. 137 and 139 First Street, San Francisco.

Wear a Smile.—Children, which you do? Smile and make others happy, or be crabbed and make everybody around you miserable? You can live among beautiful flowers and singing birds, or in the mire surrounded by frogs and fogs. The amount of happiness you can produce is incalculable, if you will show a smiling face, a kind heart, and speak pleasant words. On the other hand, by sour looks, cross words, and a fretful disposition, you can make hundreds unhappy almost beyond endurance. Which will you do? Wear a pleasant countenance, let joy beam in your eye and love glow on your forehead. There is no joy so great as that which springs from a kind act or a pleasant deed, and you may feel it at night when you rest, and at morning when you rise, and through the day when about your daily business.

The Gold Product.—Mr. A. D. Richardson, in one of his recent letters, says: "Within ten years after the cars run from ocean to ocean, the gold product of the Pacific coast will reach $500,000,000 per annum."

The Daily Evening Tribune made its first appearance in this city on Thursday, P. M. bright and new.

The Press is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

AN ICE-COVERED CONTINENT.—According to Professor Agassiz, the continent of North America was once covered with ice a mile in thickness. In proof of this conclusion, he says that the slopes of the Alleghany range of mountains are glacier-worn to the very top, except a few points which were above the level of the icy mass. Mount Washington, for instance, over six thousand feet high, and the rough, unpolished surface of its summit covered with loose fragments, just below the level of which glacier marks come to an end, tells that it lifted its head above an ice-covered continent.

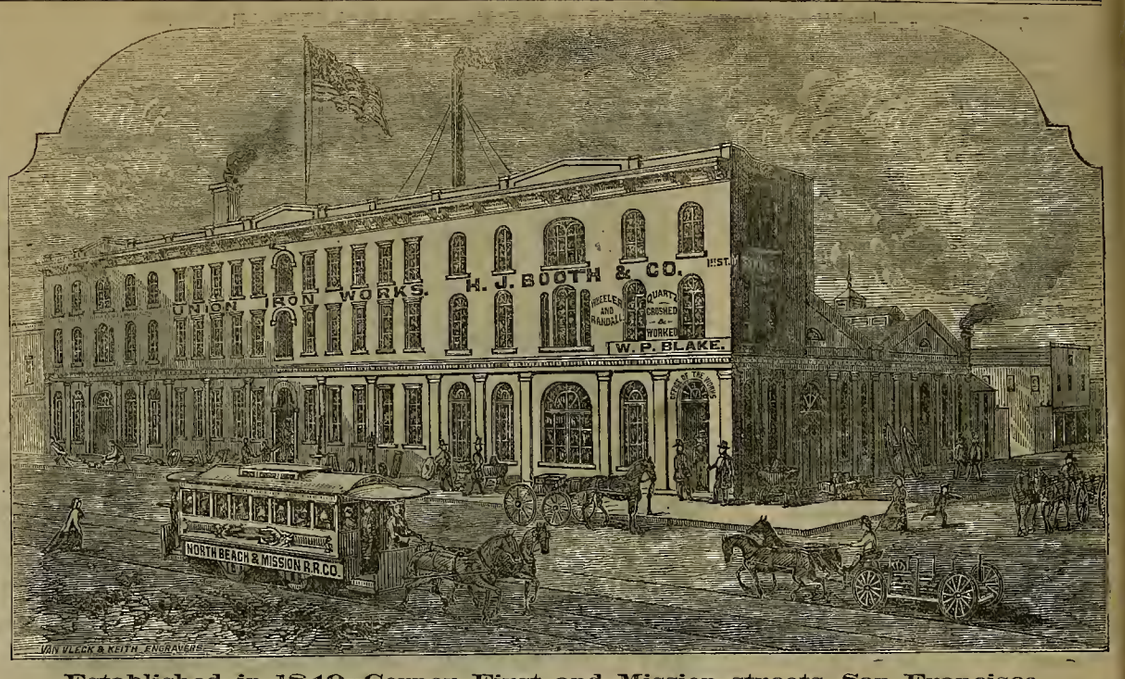
221 Mission street, below Beale, San Francisco, PRACTICAL IRON FOUNDERS, having unequalled facilities for the manufacture of LIGHT FANCY CASTINGS, particular attention will be given to this department. We manufacture School Seats and Desks, Agricultural Implements, Railing, Ship Castings, Stake Irons, and all other kinds of HEAVY and LIGHT CASTINGS, with dispatch. The patronage of the public is respectfully solicited. 24v12-1y



Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

Familiar Science.

SOUND is usually produced by the vibration of some sonorous substance, which vibration produces motion in the air, called sound waves, which strike upon the drum of the ear—precisely as when you throw a stone into still water a series of concentric waves is produced which roll outward in every direction. Sound travels in the air about thirteen miles a minute; it travels much faster through a solid medium, as iron for instance. In a perfect vacuum there could not be any such thing as sound. If a cannon should be fired in a perfect vacuum, it would give no report. Sound can be heard much farther in a cold day than a warm one, for the reason that the air is denser in cold weather. The report of a pistol is much louder in a valley than on a mountain for the same reason.

Why are copper and iron sonorous, while lead is not? Copper and iron are hard and elastic, while lead is neither, and is therefore not sonorous. Steel is harder and more elastic than iron, and is therefore more sonorous. It is so much so that most large bells are now made of that metal.

Why is not pure copper used in making bells? Because the addition of a small quantity of tin and zinc makes it harder and therefore more sonorous. Hence the composition known as bell-metal.

Why can we not hear as distinctly in misty or snowy weather as in a clear day? Because the air is not of uniform density; the particles of water or of snow obstruct the sound waves. It is for the same reason that partition walls in houses should be filled with shavings or sawdust, when we do not wish the sound of voices or any other confusion to pass through from one room to another.

Why do shavings or saw-dust prevent the passage of sound? Because they present different *media* of various densities for the sound to traverse—first the rare medium of the air of the room, second the dense medium of lath and plaster, third the rarer medium of saw-dust and shavings, then the lath and plaster and air again. This change of medium has a wonderful effect in diminishing the force of sound waves.

We have already, in another number of the paper, told our readers that when the vibrations are less than sixteen in a second of time a continuous sound cannot be communicated to the ear. Sixteen vibrations of a musical chord is therefore the lowest musical or definite sound which can be communicated; any less number of vibrations produces nothing but a succession of hoarse sounds or jars, which conveys no idea of harmony. Now how *great* a number of vibrations is the ear capable of appreciating?

The books tell us (and man has been able to very accurately measure them), that "The human ear is capable of appreciating as many as 24,000 vibrations in *one second* of time; and consequently is able to hear and distinguish a sound which lasts only the twenty-four thousandth part of a second!"

PHILOSOPHY OF THE TOP.—Why does not a top fall when spinning—even though leaning so far as to be past its center of gravity? Few of our younger readers, we presume, will be able to answer this question. It may be explained in this wise: If a heavy ball, held by a string, be whirled rapidly around, its centrifugal force will not allow it to be deflected from its course except by coming in contact with some body capable of quite strong resistance. For instance, if a stout sheet of paper be so held as to deflect it, even to the slightest extent, it will burst through the impediment, and retain its direct whirling motion. Each particle of the top, while kept in rapid revolution around the central axis, is continued in its orbit on precisely the same principle. The axis of revolution is disinclined to change its direction, and keeps it with a force proportioned to the weight of each part of the revolving body and its distance from the axis. This is manifested and kept up for a while even when the top is leaning over so far as to be past its centre of gravity; a condition under which it would fall instanter, if the body was at rest.

WHY DOES INDIAN RUBBER ERASE PENCIL MARKS FROM PAPER?—It is explained thus: The pencil mark consists of carbon rubbed off from the black lead of the pencil; Indian rubber also consists mainly of carbon; and when the carbon of the rubber is brought in close contact with the carbon of the pencil mark in the process of rubbing, the smaller quantity of carbon in the pencil mark is attracted by the larger mass of carbon in the rubber, and thus removed from the paper.

Black lead or plumbago, which forms the marking portion of the pencil, is a mineral substance, composed chiefly of carbon, but with a very small proportion of oxide of iron. Indian rubber is a vegetable substance, which exudes from a tree, and is a compound of carbon and hydrogen, in the proportion of ninety parts of the former to ten of the latter.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

EUROPEAN METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

COMBINING THE MAXIMUM OF EFFICIENCY, DURability, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by **TREADWELL & CO.,**

Capitalists, Attention!

QUARTZ MILL & MINING PROPERTY
FOR SALE
In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily-timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam-power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price.

Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear rigid scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 22v12

Office, 338 Montgomery street, San Francisco, Cal. je16

Silver Queen Mining Company, Reese River District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of April, 1866, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 608 Merchant street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 23d day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 23d day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

I. T. MILLIKEN, Secretary.

Office, 608 Merchant street, San Francisco, Cal. ap28

Sweet Vengeance Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 21st day of June, 1866, an assessment of one dollar per share was levied upon the capital stock of said Company, payable forthwith, in United States gold and silver coin, to the Secretary, at his office, No. 705 Sansome street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of July, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifteenth day of August, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

F. S. SPRING, Secretary.

Office, No. 705 Sansome street, San Francisco. je23

Union Mattole Oil Company. Location of Works: Humboldt County, State of California.

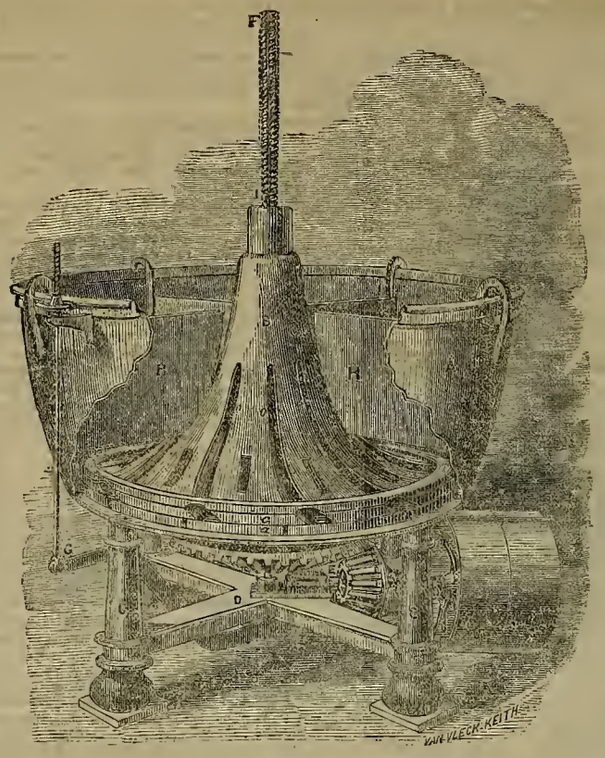
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth (4th) day of June, 1866, an assessment of five dollars ($5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Treasurer, W. C. PARKER, No. 608 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the sixteenth (16th) day of July, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth (20th) day of August, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. WINTER, Secretary.

Office, No. 608 Montgomery Street. jy9

THE EXCELSIOR
GRINDER AND AMALGAMATOR.



In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diamcter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.
15v12-3m

BRUCKNER'S
Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFter an improved mode of construction, which

GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxydizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

will soon be more fully described and illustrated in the columns of the MINING AND SCIENTIFIC PRESS.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,
19v12 416 Market street, San Francisco.

Machinery.

SAVE YOUR MONEY AND BUY,

For $100!

HUNTER'S

Premium Concentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY IMproved and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 135 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent. more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 118 Washington street, below Davis, where ALBERT JACOBS will fill their orders promptly.

ANDREW HUNTER,
17v12-tf Inventor.

THE SAN FRANCISCO

BOOT AND SHOE NAILING MACHINE.

THIS MACHINE MAY NOW BE SEEN IN DAILY OPERation at the corner of Stockton and O'Farrell streets, where the inventor may be seen and consulted at all hours.

He is especially anxious that Boot and Shoemakers, Mechanics generally, and all persons interested in the success of California inventions and California manufactures, should call and examine this specimen of California ingenuity.

The proprietor is making arrangements for their manufacture in this city; and he is now ready to contract to furnish the machine to such parties as may be desirous to purchase the same.

E. T. BARLOW.
San Francisco, June 22d, 1866. 25v12

$100 Reward!

THE ABOVE REWARD WILL BE PAID TO ANY ONE who will produce evidence of a failure of any of

Hendy's Improved Self-Discharging Concentrators,

Patented February 27th, and April 17th, 1866—which said amount is deposited for 60 days with Palmer, Knox & Co., No. 19 First street, San Francisco. Send for a circular containing a description of the machine.

J. HENDY, Patentee,
25v12-tf No. 402 Montgomery St., Room 3, 4th Floor. S. F.

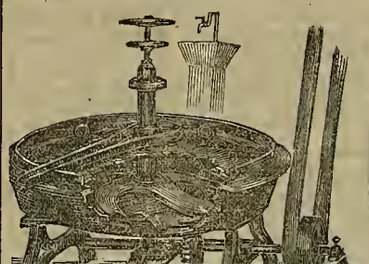
BAUX & GUIOD'S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6tf

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT the "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

FLORENCE
SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO THE—

Florence Sewing Machine Company,

FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

1st.—Its simplicity and great range of work.

2d.—The Reversible Feed Motion.

3d.—The perfect finish and substantial manner in which the machine is made.

4th.—The rapidity of its working and the quality of the work done.

5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

☞ Send for Illustrated Catalogue. 23v12-2m

TWELFTH VOLUME.—The MINING AND SCIENTIFIC PRESS, published at San Francisco, commenced its twelfth volume on the 6th inst.—[Nye County News,

INEXHAUSTIBLE IVORY.—New Siberia and the Isle of Lackon are, for the most part, only an agglomeration of sand, ice, and elephants' teeth. At every tempest the sea casts ashore fresh heaps of mammoth tusks, and the inhabitants are able to drive a profitable trade in the fossil ivory thrown up by the waves. During summer, innumerable fishermen's barks direct their course to this isle of bones; and in winter, immense caravans take the same route, all the convoys drawn by dogs, returning charged with the tusks of the mammoth, weighing each from a hundred and fifty to two hundred pounds. The fossil ivory thus obtained from the frozen north, is imported into China and Europe, where it is employed for the same purposes as ordinary ivory, which is furnished, as we know, by the elephant and hippotamus of Africa and Asia. The isle of bones has served as a quarry for this valuable material for export to China for upwards of five hundred years; and it has been exported to Europe for upwards of a hundred years. But the supply from these strange mines remains undiminished. What a number of accumulated generations does not this profusion of bones and tusks imply!

AN OLD SCHOOL-HOUSE CONTRACT.—The contract for building a school-house in Auburn, says the *Stars and Stripes*, is to be let soon. It will differ materially from the one under which the first school-house in Springfield, Mass., was built in 1679. The old town record, after reciting the proceedings under which the selectmen had made the bargain, says:

"Accordingly they have bargained with Tho. Stebbein, Junr, to get timber for such a building and frame it, whose length is to be 22 foot and breadth 17 foot and stud 8 foot & halfe: & he, the said Tho. Stebbein, is to carry the frame to place & to naile the clapboards close on both sides and ends, and to shingle the roofe, and to make three light spaces on one side and two lights on one end, and to set up a mantletree, and to set up a run and chimney, and to danb it, and the said Thomas is to have for his worke so done 14 pounds paid him by the towne, and in case it so prove that the said Tho. Stebbein shall have an hard bargaine, it is hereby agreed that he shall have 10 shillings more of the towne."

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

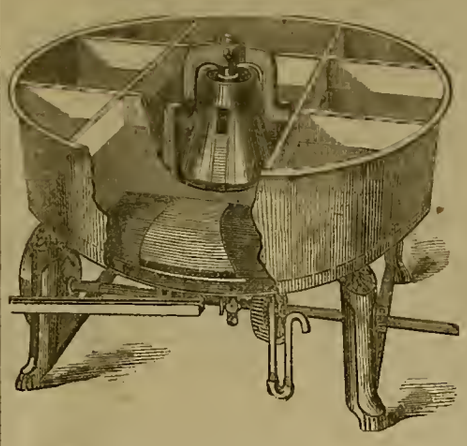
Apothecaries' Hall, No. 521 Montgomery street,
15v12ly Between Clay and Commercial, San Francisco.

Knox's Improved Patent Amalgamator and Separator,
With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of EIGHT YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam-mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

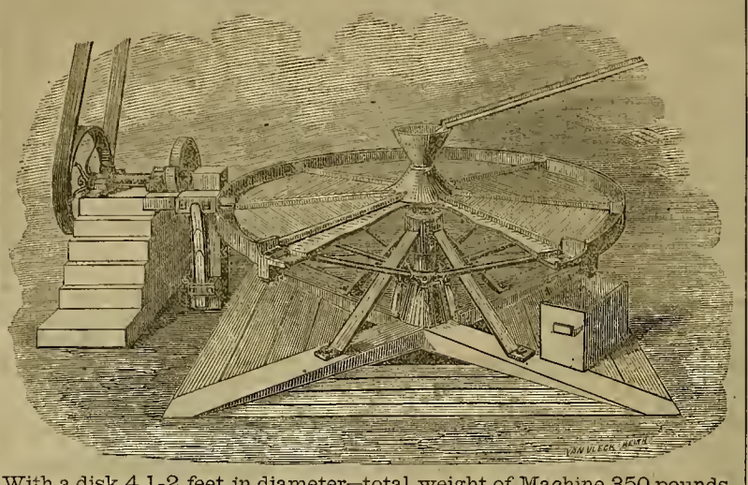
3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

☞ For further particulars, inquire of ISRAEL W. KNOX, or
W. A. PALMER, Inventors,
14v13-pl2q At the Golden State Iron Works, No. 19 First street, San Francisco.

VARNEY'S CONCENTRATOR,



With a disk 4 1-2 feet in diameter—total weight of Machine 350 pounds.

Is driven by one-eighth of a horse-power, and will concentrate eight tons of ore per day, and make the sulphure clean. Larger ones do work in proportion to size.

REMINGTONS'
ARMY AND NAVY REVOLVER,
THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a TOP STRAP or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

ALBERT E. CRANE, Manufacturers' Agent,

VARNEY'S
PATENT AMALGAMATOR.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

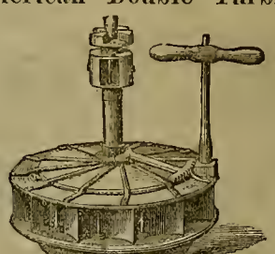
This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

LEFFEL'S
American Double Turbine
WATER WHEEL.



THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given universal satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

New Mining Laws of California and Neva

We have just issued, in cheap edition, the r laws relating to mining and corporations in C fornia and Nevada, passed in 1865–6. Some these laws are of the highest importance to par interested in the matter of locating and hold claims, and prospecting mines, in these Sta Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Patent Agents San Francisco, May 1st, 1866.

Judicious Resolutions.

Several of our most substantial and ju ciously managed mining corporations ha passed resolutions, since the approval of t new assessment law, requiring all notice of assessments and sales to be published in t MINING AND SCIENTIFIC PRESS, the only th ough (daily or weekly) mining journal on t coast. Our efforts to concentrate all min advertisements in one paper, for the economi convenience of shareholders and assessm payers, are meeting with decided succe Those who believe in supporting the min cause, should bear our paper in mind, a bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.
